

# Intro to Apache Spark

<http://databricks.com/>

download slides:

[http://cdn.liber118.com/workshop/itas\\_workshop.pdf](http://cdn.liber118.com/workshop/itas_workshop.pdf)

**00: Getting Started**

# **Introduction**

**installs + intros, while people arrive: 20 min**

## **Intro:** Online Course Materials

Best to download the slides to your laptop:

**[cdn.liberal8.com/workshop/itas\\_workshop.pdf](cdn.liberal8.com/workshop/itas_workshop.pdf)**

Be sure to complete the course survey:

**<http://goo.gl/QpBSnR>**

In addition to these slides, all of the code samples are available on GitHub gists:

- **<gist.github.com/ceteri/f2c3486062c9610eacd>**
- **<gist.github.com/ceteri/8ae5b9509a08c08a1132>**
- **<gist.github.com/ceteri/11381941>**

## **Intro:** Success Criteria

By end of day, participants will be comfortable with the following:

- open a Spark Shell
- use of some ML algorithms
- explore data sets loaded from HDFS, etc.
- review Spark SQL, Spark Streaming, Shark
- review advanced topics and BDAS projects
- follow-up courses and certification
- developer community resources, events, etc.
- return to workplace and demo use of Spark!

## **Intro:** Preliminaries

- intros – what is your background?
- who needs to use AWS instead of laptops?
- PEM key, if needed? See tutorial:  
**[Connect to Your Amazon EC2 Instance from Windows Using PuTTY](#)**

# 01: Getting Started

## Installation

**hands-on lab: 20 min**

## **Installation:**

Let's get started using Apache Spark,  
in just four easy steps...

**[spark.apache.org/docs/latest/](http://spark.apache.org/docs/latest/)**

**(for class, please copy from the USB sticks)**

## **Step 1: Install Java JDK 6/7 on MacOSX or Windows**

**[oracle.com/technetwork/java/javase/downloads/jdk7-downloads-1880260.html](http://oracle.com/technetwork/java/javase/downloads/jdk7-downloads-1880260.html)**

- follow the license agreement instructions
- then click the download for your OS
- need JDK instead of JRE (for Maven, etc.)

**(for class, please copy from the USB sticks)**

## **Step 1: Install Java JDK 6/7 on Linux**

this is much simpler on Linux...

```
sudo apt-get -y install openjdk-7-jdk
```

## **Step 2:** Download Spark

we'll be using Spark 1.0.0

see [spark.apache.org/downloads.html](http://spark.apache.org/downloads.html)

1. download this URL with a browser
2. double click the archive file to open it
3. connect into the newly created directory

**(for class, please copy from the USB sticks)**

## **Step 3: Run Spark Shell**

we'll run Spark's interactive shell...

```
./bin/spark-shell
```

then from the “scala>” REPL prompt,  
let's create some data...

```
val data = 1 to 10000
```

## **Step 4:** Create an RDD

create an **RDD** based on that data...

```
val distData = sc.parallelize(data)
```

then use a filter to select values less than 10...

```
distData.filter(_ < 10).collect()
```

## **Step 4: Create an RDD**

create an

```
val distData = sc.parallelize(data)
```

then use a filter to select values less than 10 ...

d

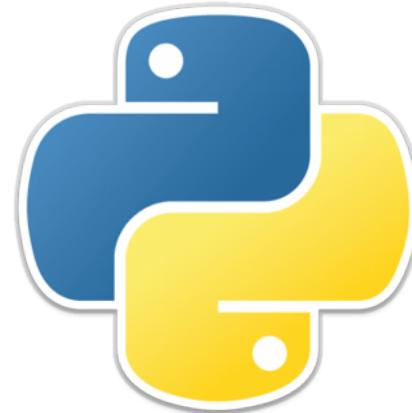

**Checkpoint:  
what do you get for results?**

**[gist.github.com/ceteri/  
f2c3486062c9610eac1d#file-01-repl-txt](https://gist.github.com/ceteri/f2c3486062c9610eac1d#file-01-repl-txt)**

## **Installation:** *Optional Downloads: Python*

For Python 2.7, check out *Anaconda* by Continuum Analytics for a full-featured platform:

**[store.continuum.io/cshop/anaconda/](http://store.continuum.io/cshop/anaconda/)**

## **Installation:** *Optional Downloads: Maven*

Java builds later also require Maven, which you can download at:

**[maven.apache.org/download.cgi](http://maven.apache.org/download.cgi)**

The logo for Maven, featuring the word "maven" in a lowercase, bold, sans-serif font. The letter "a" is unique, consisting of two overlapping shapes: a black trapezoid on top and an orange trapezoid on the bottom.

## 03: Getting Started

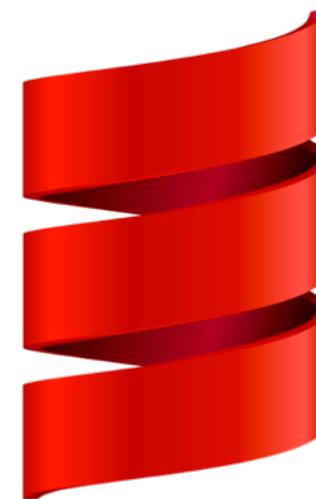

# Spark Deconstructed

**lecture: 20 min**

## **Spark Deconstructed:**

Let's spend a few minutes on this Scala thing...

[scala-lang.org/](http://scala-lang.org/)

## Spark Deconstructed: Log Mining Example

```
// load error messages from a log into memory
// then interactively search for various patterns
// https://gist.github.com/ceteri/8ae5b9509a08c08a1132

// base RDD
val lines = sc.textFile("hdfs://...")

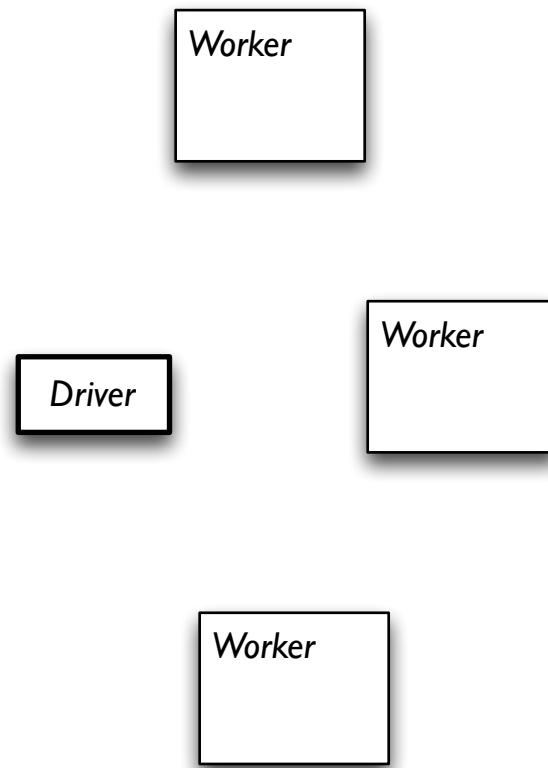

// transformed RDDs
val errors = lines.filter(_.startsWith("ERROR"))
val messages = errors.map(_.split("\t")).map(r => r(1))
messages.cache()

// action 1
messages.filter(_.contains("mysql")).count()

// action 2
messages.filter(_.contains("php")).count()
```

## **Spark Deconstructed: Log Mining Example**

We start with Spark running on a cluster...  
submitting code to be evaluated on it:

# Spark Deconstructed: Log Mining Example

```
// base RDD
val lines = sc.textFile("hdfs://...")

// transformed RDDs
val errors = lines.filter(_.startsWith("ERROR"))
val messages = errors.map(_.split("\t")).map(r => r(1))
messages.cache()
```

```
// action 1
messages.filter(_.contains("mysql")).count()
```

**discussing the other part**

```
// action 2
messages.filter(_.contains("php")).count()
```

## Spark Deconstructed: Log Mining Example

At this point, take a look at the transformed RDD *operator graph*:

```
scala> messages.toDebugString
res5: String =
MappedRDD[4] at map at <console>:16 (3 partitions)
  MappedRDD[3] at map at <console>:16 (3 partitions)
    FilteredRDD[2] at filter at <console>:14 (3 partitions)
      MappedRDD[1] at textFile at <console>:12 (3 partitions)
        HadoopRDD[0] at textFile at <console>:12 (3 partitions)
```

# Spark Deconstructed: Log Mining Example

```
// base RDD
val lines = sc.textFile("hdfs://...")

// transformed RDDs
val errors = lines.filter(_.startsWith("ERROR"))
val messages = errors.map(_.split("\t")).map(r => r(1))
messages.cache()

// action 1
messages.filter(_.contains("mysql")).count()

// action 2
messages.filter(_.contains("php")).count()
```

discussing the other part

// transformed RDDs
val errors = lines.filter(_.startsWith("ERROR"))
val messages = errors.map(_.split("\t")).map(r => r(1))
messages.cache()
```

# Spark Deconstructed:

```
// action 1  
messages.filter(_.contains("mysql")).count()
```

## 04: Getting Started

# Simple Spark Apps

**lab: 20 min**

# Simple Spark Apps: WordCount

*Definition:*

*count how often each word appears  
in a collection of text documents*

This simple program provides a good test case for parallel processing, since it:

- requires a minimal amount of code
- demonstrates use of both symbolic and numeric values
- isn't many steps away from search indexing
- serves as a "Hello World" for Big Data apps

A distributed computing framework that can run WordCount **efficiently in parallel at scale** can likely handle much larger and more interesting compute problems

```
void map (String doc_id, String text):  
    for each word w in segment(text):  
        emit(w, "1");  
  
void reduce (String word, Iterator group):  
    int count = 0;  
  
    for each pc in group:  
        count += Int(pc);  
  
    emit(word, String(count));
```

## Simple Spark Apps: WordCount

### Scala:

```
val f = sc.textFile("README.md")
val wc = f.flatMap(l => l.split(" ")).map(word => (word, 1)).reduceByKey(_ + _)
wc.saveAsTextFile("wc_out.txt")
```

### Python:

```
from operator import add
f = sc.textFile("README.md")
wc = f.flatMap(lambda x: x.split(' ')).map(lambda x: (x, 1)).reduceByKey(add)
wc.saveAsTextFile("wc_out.txt")
```

## Simple Spark Apps: WordCount

Scala:

```
val f = sc.textFile()  
val wc  
wc.saveAsTextFile()
```

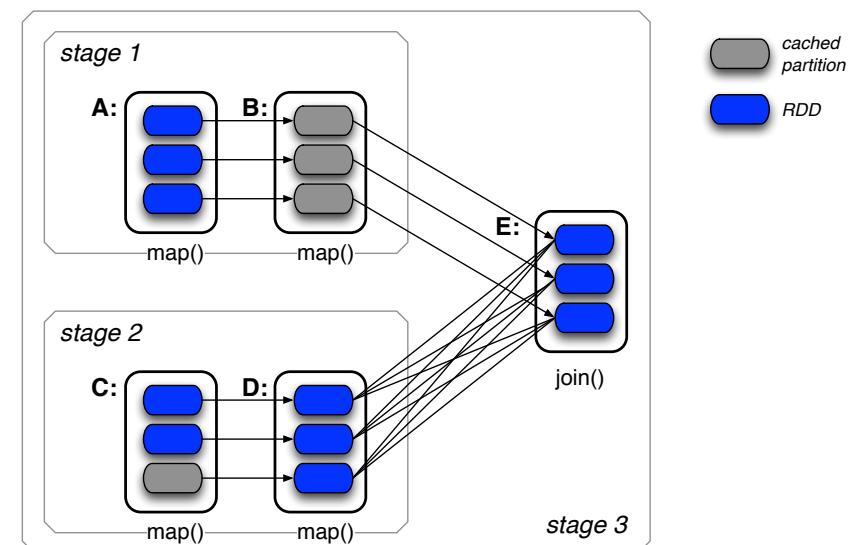

Checkpoint:  
Python how many “Spark” keywords?

```
from operator  
f = sc  
wc = f  
wc.saveAsTextFile()
```

## Simple Spark Apps: *Code + Data*

The code + data for the following example of a join is available in:

[gist.github.com/ceteri/11381941](https://gist.github.com/ceteri/11381941)

# Simple Spark Apps: Source Code

```
val format = new java.text.SimpleDateFormat("yyyy-MM-dd")

case class Register (d: java.util.Date, uuid: String, cust_id: String, lat: Float,
  lng: Float)
case class Click (d: java.util.Date, uuid: String, landing_page: Int)

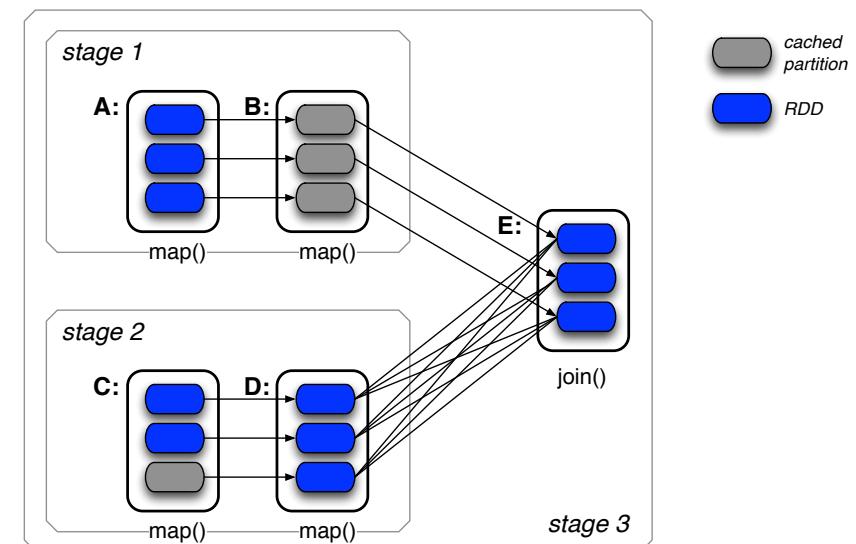

val reg = sc.textFile("reg.tsv").map(_.split("\t")).map(
  r => (r(1), Register(format.parse(r(0)), r(1), r(2), r(3).toFloat, r(4).toFloat)))
)

val clk = sc.textFile("clk.tsv").map(_.split("\t")).map(
  c => (c(1), Click(format.parse(c(0)), c(1), c(2).trim.toInt)))
)

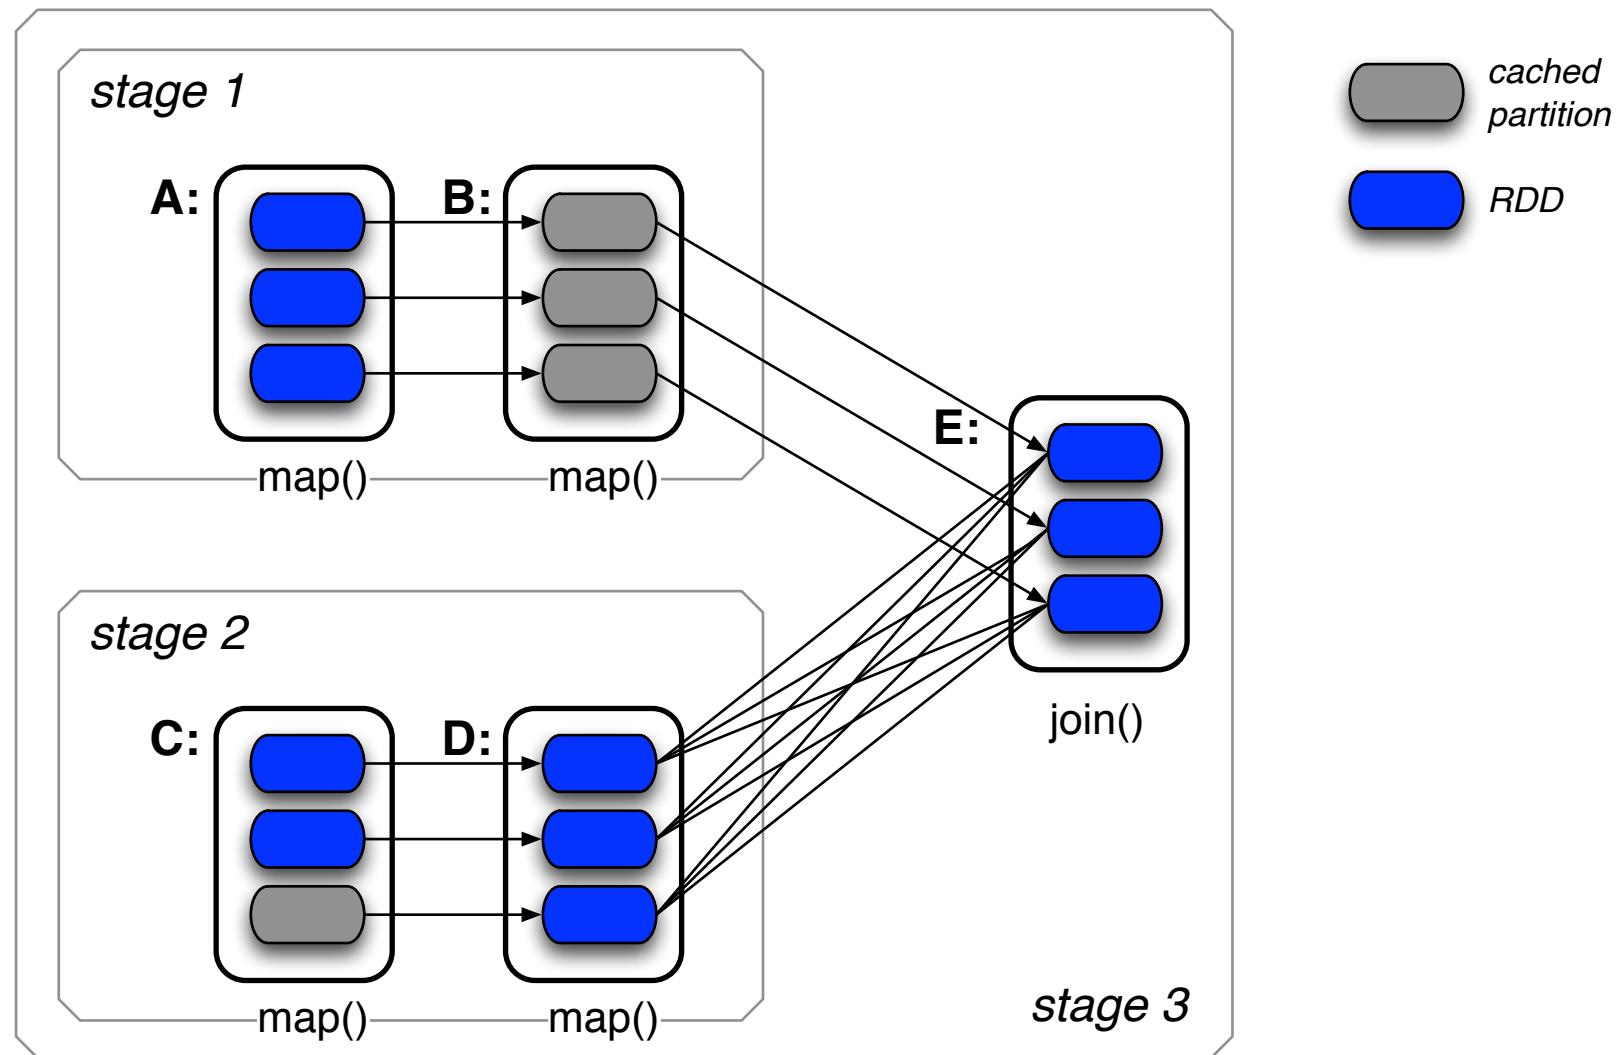

reg.join(clk).take(2)
```

# Simple Spark Apps: Operator Graph

```
scala> reg.join(clk).toDebugString
res5: String =
FlatMappedValuesRDD[ 46] at join at <console>:23 (1 partitions)
  MappedValuesRDD[ 45] at join at <console>:23 (1 partitions)
    CoGroupedRDD[ 44] at join at <console>:23 (1 partitions)
      MappedRDD[ 36] at map at <console>:16 (1 partitions)
        MappedRDD[ 35] at map at <console>:16 (1 partitions)
          MappedRDD[ 34] at textFile at <console>:16 (1 partitions)
            HadoopRDD[ 33] at textFile at <console>:16 (1 partitions)
  MappedRDD[ 40] at map at <console>:16 (1 partitions)
    MappedRDD[ 39] at map at <console>:16 (1 partitions)
      MappedRDD[ 38] at textFile at <console>:16 (1 partitions)
        HadoopRDD[ 37] at textFile at <console>:16 (1 partitions)
```

# Simple Spark Apps: Operator Graph

## **Simple Spark Apps:** Assignment

Using the README.md and CHANGES.txt files in the Spark directory:

1. create RDDs to filter each line for the keyword “Spark”
2. perform a WordCount on each, i.e., so the results are (K,V) pairs of (word, count)
3. join the two RDDs

## **Simple Spark Apps:** Assignment

Using the  
the Spark directory:

- I. create RDDs to filter each file for the keyword  
“Spark”
- II. perform a join on the two RDDs to get the result
- III. checkpoint the RDDs and count the number of “Spark” keywords?

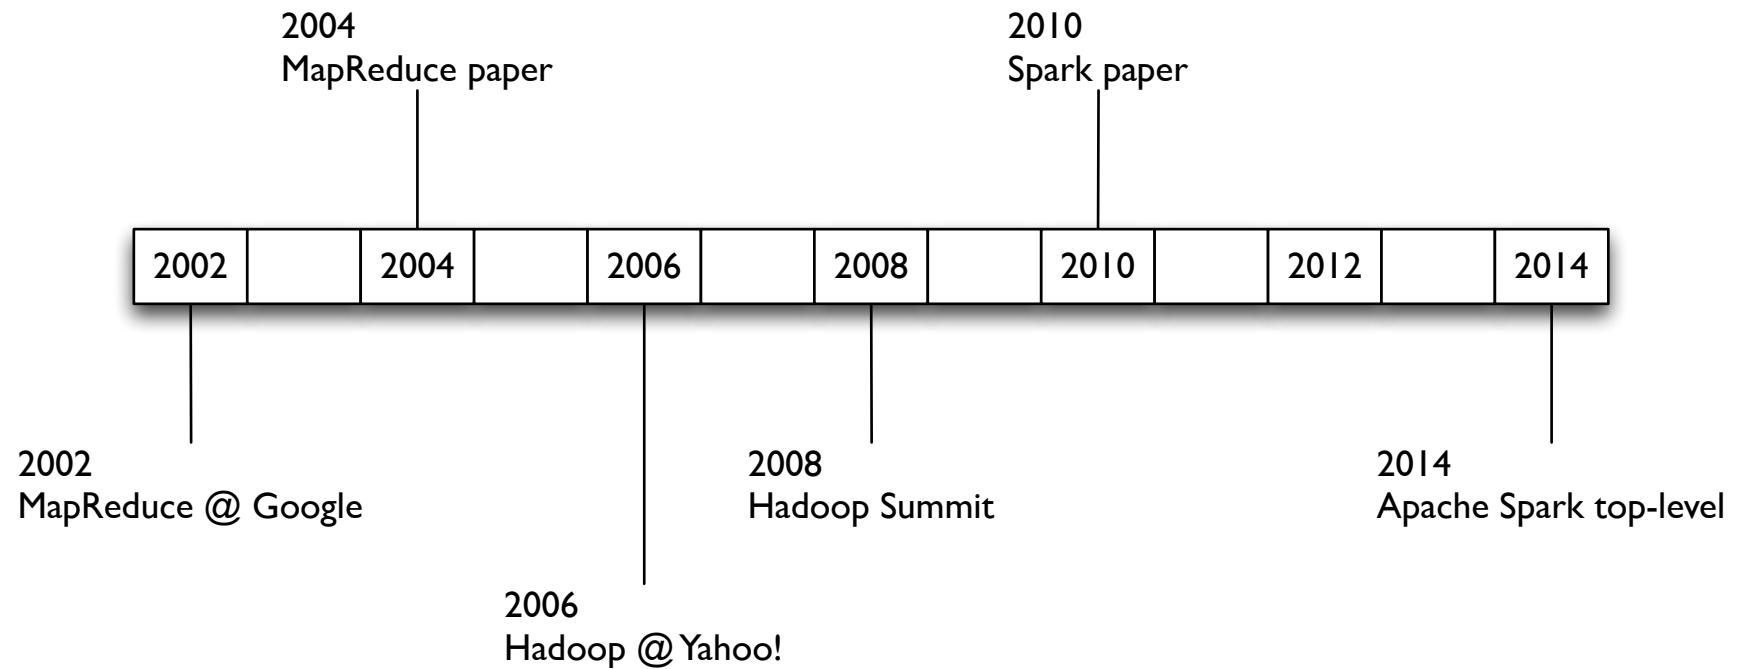

**Checkpoint:  
how many “Spark” keywords?**

## 05: Getting Started

*Hadoop Summit, HUG, etc.*

[developer.yahoo.com/hadoop/](http://developer.yahoo.com/hadoop/)

circa 2009 – Amazon AWS

Elastic MapReduce

Hadoop modified for EC2/S3, plus support for Hive, Pig, Cascading, etc.

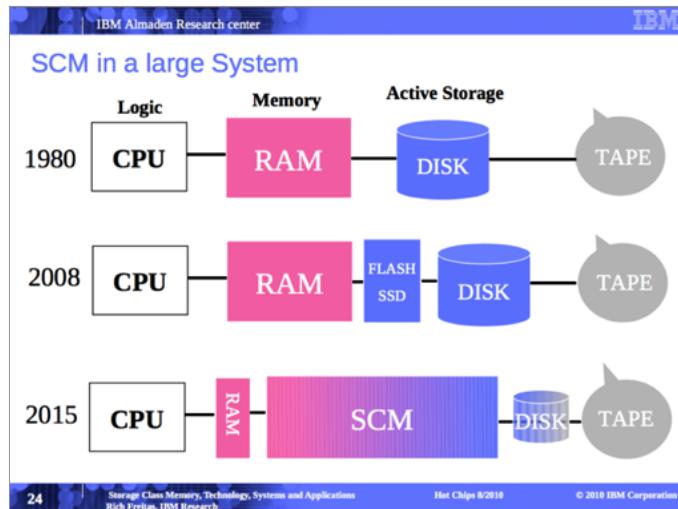

[aws.amazon.com/elasticmapreduce/](http://aws.amazon.com/elasticmapreduce/)

## **A Brief History:** MapReduce

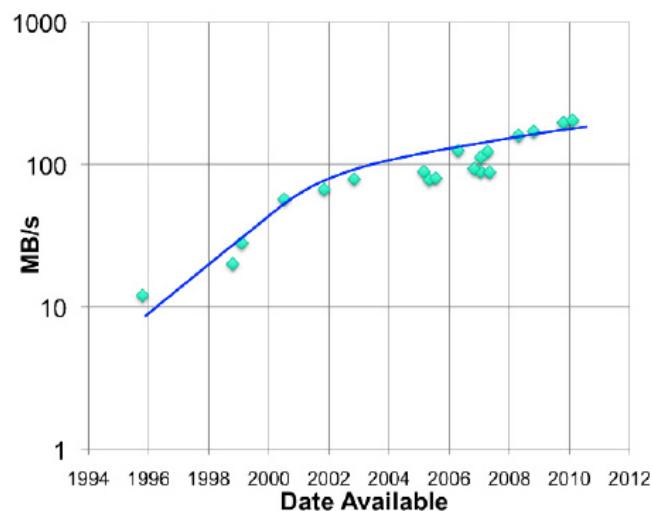

### Open Discussion:

*Enumerate several changes in data center technologies since 2002...*

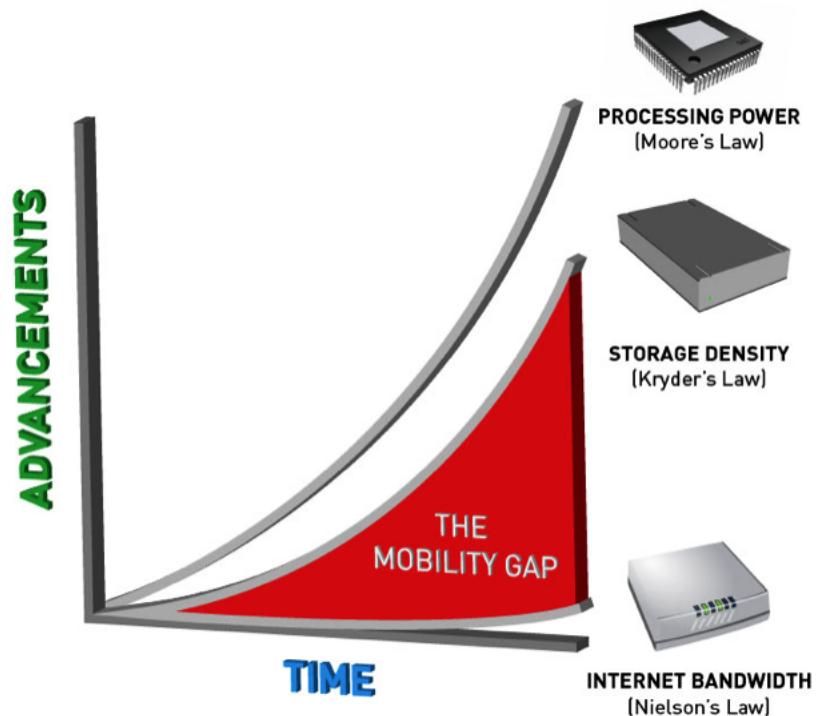

# A Brief History: MapReduce

Rich Freitas, IBM Research

[storagenewsletter.com/rubriques/hard-disk-drives/hdd-technology-trends-ibm/](http://storagenewsletter.com/rubriques/hard-disk-drives/hdd-technology-trends-ibm/)

[pistoncloud.com/2013/04/storage-and-the-mobility-gap/](http://pistoncloud.com/2013/04/storage-and-the-mobility-gap/)

*meanwhile, spinny disks haven't changed all that much...*

## **A Brief History:** MapReduce

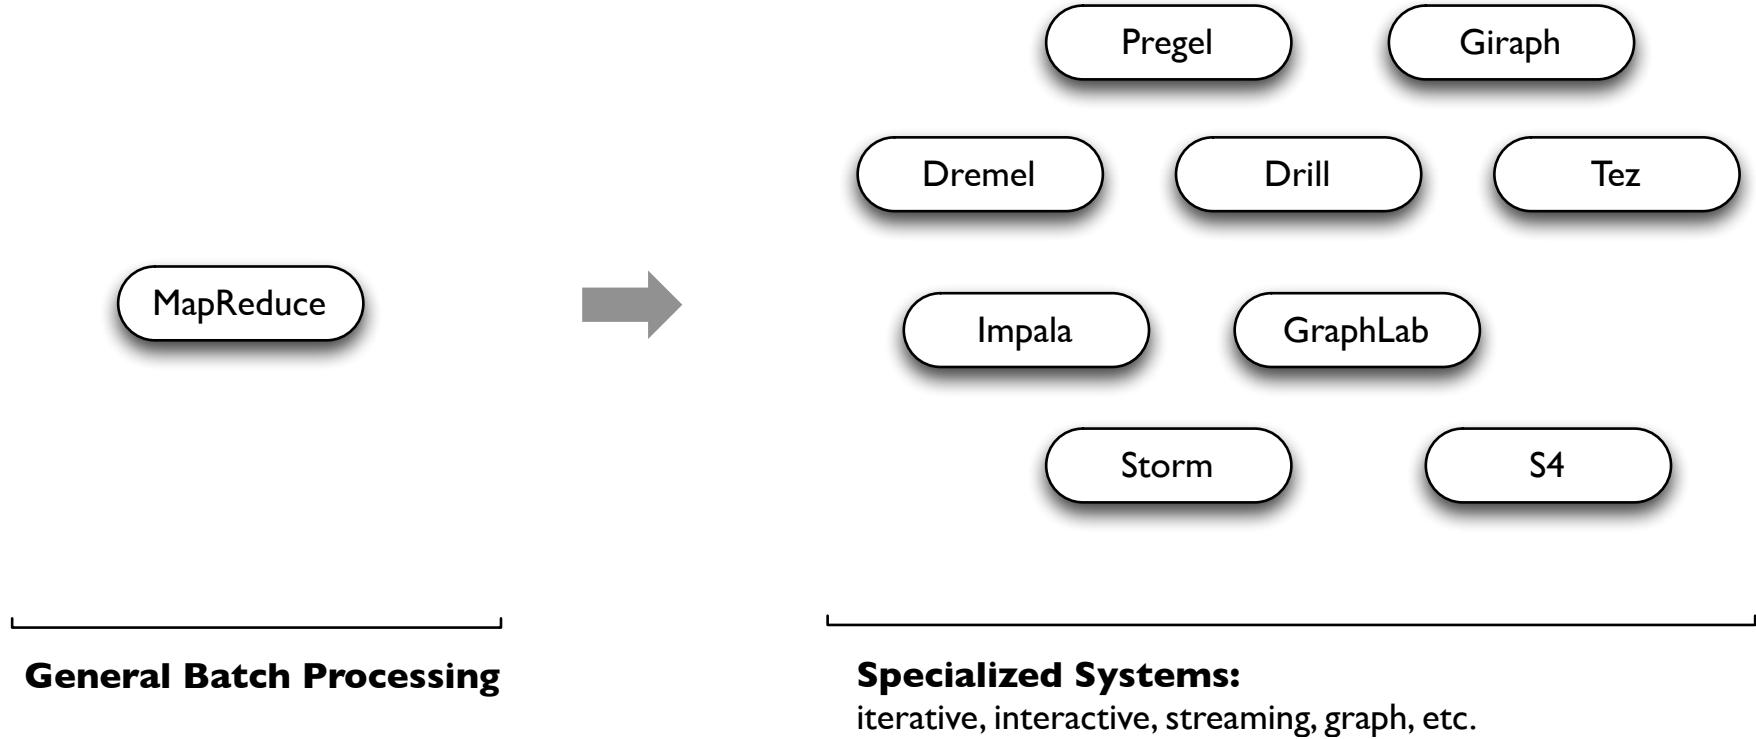

MapReduce use cases showed two major limitations:

1. difficulty of programming directly in MR
2. performance bottlenecks, or batch not fitting the use cases

In short, MR doesn't compose well for large applications

Therefore, people built *specialized systems* as workarounds...

## A Brief History: *Spark*

Unlike the various specialized systems, Spark's goal was to generalize MapReduce to support new apps within same engine

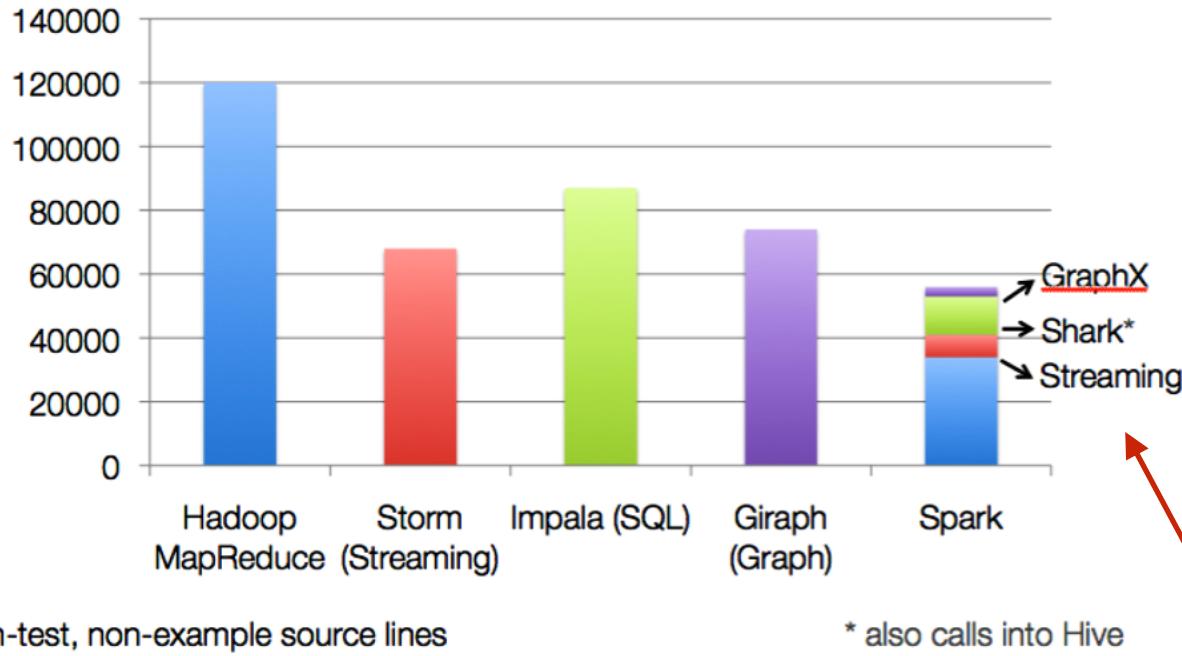

Two reasonably small additions are enough to express the previous models:

- *fast data sharing*
- *general DAGs*

This allows for an approach which is more efficient for the engine, and much simpler for the end users

# A Brief History: Spark

## Code Size

*The State of Spark, and Where We're Going Next*  
**Matei Zaharia**  
Spark Summit (2013)  
[youtu.be/nU6vO2EJAb4](https://youtu.be/nU6vO2EJAb4)

*used as libs, instead of  
specialized systems*

## **A Brief History:** *Spark*

Some key points about Spark:

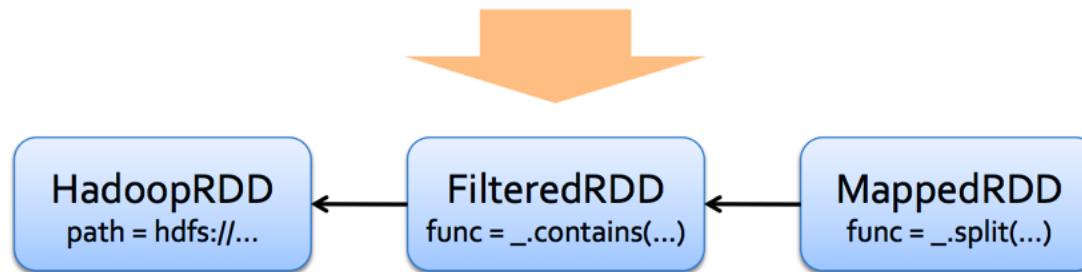

- handles batch, interactive, and real-time within a single framework
- native integration with Java, Python, Scala
- programming at a higher level of abstraction
- more general: map/reduce is just one set of supported constructs

## A Brief History: Spark

# RDD Fault Tolerance

RDDs track the series of transformations used to build them (their *lineage*) to recompute lost data

E.g: `messages = textFile(...).filter(_.contains("error"))  
 .map(_.split('\t'))(2)`

## 03: Intro Spark Apps

# Spark Essentials

**lecture/lab: 45 min**

## **Spark Essentials:**

Intro apps, showing examples in both Scala and Python...

Let's start with the basic concepts in:

**[spark.apache.org/docs/latest/scala-programming-guide.html](http://spark.apache.org/docs/latest/scala-programming-guide.html)**

using, respectively:

`./bin/spark-shell`

`./bin/pyspark`

alternatively, with IPython Notebook:

```
IPYTHON_OPTS="notebook --pylab inline" ./bin/pyspark
```

## **Spark Essentials:** *SparkContext*

First thing that a Spark program does is create a `SparkContext` object, which tells Spark how to access a cluster

In the shell for either Scala or Python, this is the `sc` variable, which is created automatically

Other programs must use a constructor to instantiate a new `SparkContext`

Then in turn `SparkContext` gets used to create other variables

## **Spark Essentials:** *SparkContext*

**Scala:**

```
scala> sc
res: spark.SparkContext = spark.SparkContext@470d1f30
```

**Python:**

```
>>> sc
<pyspark.context.SparkContext object at 0x7f7570783350>
```

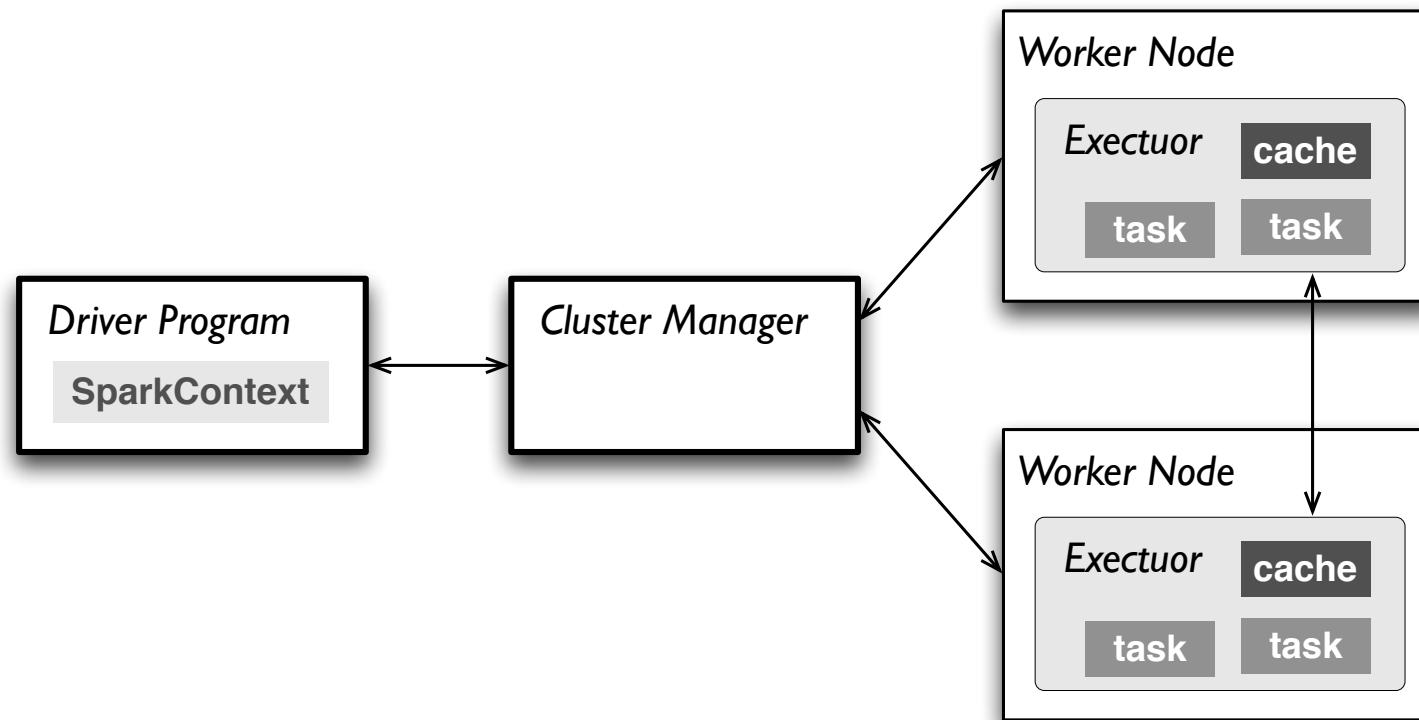

## Spark Essentials: Master

The master parameter for a SparkContext determines which cluster to use

<i>master</i>	<i>description</i>
<b>local</b>	run Spark locally with one worker thread (no parallelism)
<b>local[K]</b>	run Spark locally with K worker threads (ideally set to # cores)
<b>spark://HOST:PORT</b>	connect to a Spark standalone cluster; PORT depends on config (7077 by default)
<b>mesos://HOST:PORT</b>	connect to a Mesos cluster; PORT depends on config (5050 by default)

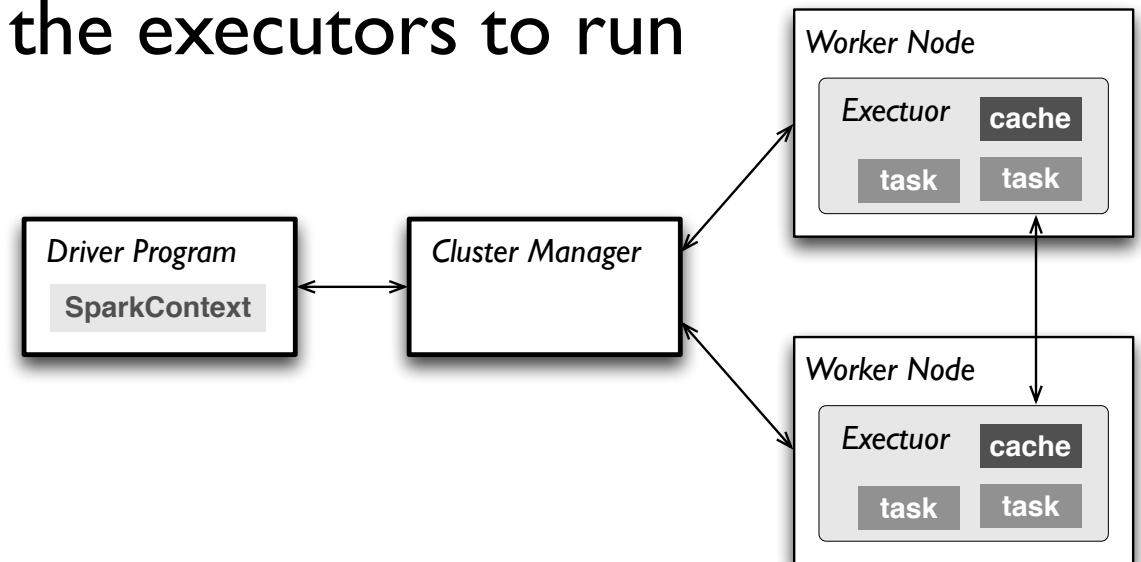

# Spark Essentials: Master

[spark.apache.org/docs/latest/cluster-overview.html](http://spark.apache.org/docs/latest/cluster-overview.html)

## Spark Essentials: Master

1. connects to a *cluster manager* which allocate resources across applications
2. acquires **executors** on cluster nodes – worker processes to run computations and store data
3. sends *app code* to the executors
4. sends *tasks* for the executors to run

## **Spark Essentials: RDD**

**R**esilient **D**istributed **D**atasets (RDD) are the primary abstraction in Spark – a fault-tolerant collection of elements that can be operated on in parallel

There are currently two types:

- *parallelized collections* – take an existing Scala collection and run functions on it in parallel
- *Hadoop datasets* – run functions on each record of a file in Hadoop distributed file system or any other storage system supported by Hadoop

## **Spark Essentials: RDD**

- two types of operations on RDDs:  
*transformations* and *actions*
- transformations are lazy  
(not computed immediately)
- the transformed RDD gets recomputed  
when an action is run on it (default)
- however, an RDD can be *persisted* into  
storage in memory or disk

# Spark Essentials: RDD

## Scala:

```
scala> val data = Array(1, 2, 3, 4, 5)
data: Array[Int] = Array(1, 2, 3, 4, 5)
```

```
scala> val distData = sc.parallelize(data)
distData: spark.RDD[Int] = spark.ParallelCollection@10d13e3e
```

## Python:

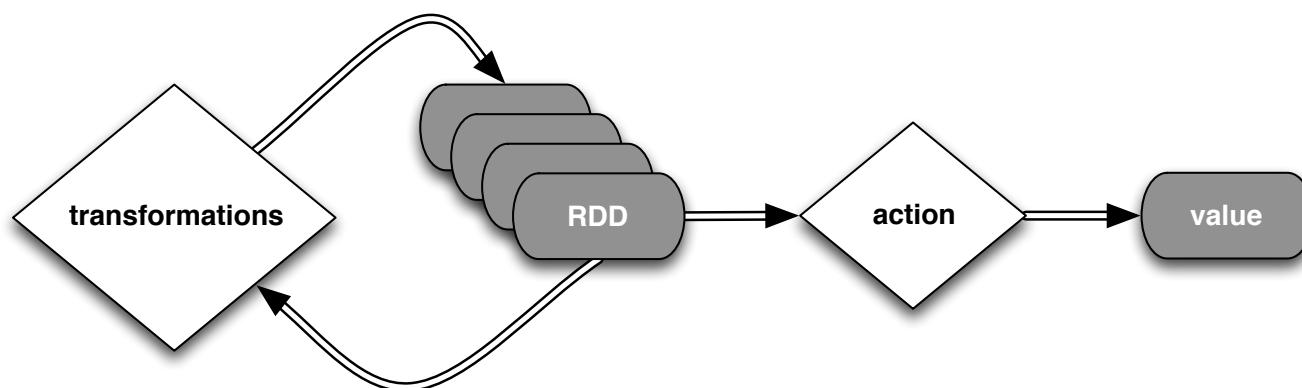

```
>>> data = [1, 2, 3, 4, 5]
>>> data
[1, 2, 3, 4, 5]
```

```
>>> distData = sc.parallelize(data)
>>> distData
ParallelCollectionRDD[0] at parallelize at PythonRDD.scala:229
```

## Spark Essentials: RDD

Spark can create RDDs from any file stored in HDFS or other storage systems supported by Hadoop, e.g., local file system, Amazon S3, Hypertable, HBase, etc.

Spark supports text files, SequenceFiles, and any other Hadoop InputFormat, and can also take a directory or a glob (e.g. /data/201404\*)

# Spark Essentials: RDD

## Scala:

```
scala> val distFile = sc.textFile("README.md")
distFile: spark.RDD[String] = spark.HadoopRDD@1d4cee08
```

## Python:

```
>>> distFile = sc.textFile("README.md")
14/04/19 23:42:40 INFO storage.MemoryStore: ensureFreeSpace(36827) called
with curMem=0, maxMem=318111744
14/04/19 23:42:40 INFO storage.MemoryStore: Block broadcast_0 stored as
values to memory (estimated size 36.0 KB, free 303.3 MB)
>>> distFile
MappedRDD[2] at textFile at NativeMethodAccessorImpl.java:-2
```

## **Spark Essentials:** *Transformations*

Transformations create a new dataset from an existing one

All transformations in Spark are *lazy*: they do not compute their results right away – instead they remember the transformations applied to some base dataset

- optimize the required calculations
- recover from lost data partitions

# Spark Essentials: Transformations

<i>transformation</i>	<i>description</i>
<b>map(<i>func</i>)</b>	return a new distributed dataset formed by passing each element of the source through a function <i>func</i>
<b>filter(<i>func</i>)</b>	return a new dataset formed by selecting those elements of the source on which <i>func</i> returns true
<b>flatMap(<i>func</i>)</b>	similar to map, but each input item can be mapped to 0 or more output items (so <i>func</i> should return a Seq rather than a single item)
<b>sample(<i>withReplacement</i>, <i>fraction</i>, <i>seed</i>)</b>	sample a fraction <i>fraction</i> of the data, with or without replacement, using a given random number generator <i>seed</i>
<b>union(<i>otherDataset</i>)</b>	return a new dataset that contains the union of the elements in the source dataset and the argument
<b>distinct([<i>numTasks</i>]))</b>	return a new dataset that contains the distinct elements of the source dataset

# Spark Essentials: Transformations

<i>transformation</i>	<i>description</i>
<b>groupByKey( [ numTasks] )</b>	when called on a dataset of (K, V) pairs, returns a dataset of (K, Seq[V]) pairs
<b>reduceByKey( func, [ numTasks] )</b>	when called on a dataset of (K, V) pairs, returns a dataset of (K, V) pairs where the values for each key are aggregated using the given reduce function
<b>sortByKey( [ ascending], [ numTasks] )</b>	when called on a dataset of (K, V) pairs where K implements Ordered, returns a dataset of (K, V) pairs sorted by keys in ascending or descending order, as specified in the boolean ascending argument
<b>join( otherDataset, [ numTasks] )</b>	when called on datasets of type (K, V) and (K, W), returns a dataset of (K, (V, W)) pairs with all pairs of elements for each key
<b>cogroup( otherDataset, [ numTasks] )</b>	when called on datasets of type (K, V) and (K, W), returns a dataset of (K, Seq[V], Seq[W]) tuples – also called groupWith
<b>cartesian( otherDataset)</b>	when called on datasets of types T and U, returns a dataset of (T, U) pairs (all pairs of elements)

## Spark Essentials: *Transformations*

Scala:

```
val distFile = sc.textFile("README.md")
distFile.map(l => l.split(" ")).collect()
distFile.flatMap(l => l.split(" ")).collect()
```

*distFile is a collection of lines*

Python:

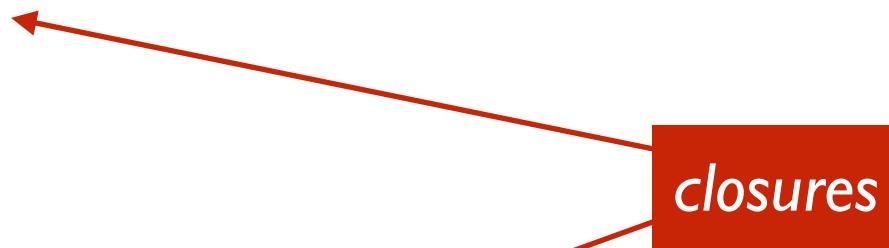

```
distFile = sc.textFile("README.md")
distFile.map(lambda x: x.split(' ')).collect()
distFile.flatMap(lambda x: x.split(' ')).collect()
```

# Spark Essentials: Transformations

Scala:

```
val distFile = sc.textFile("README.md")
distFile.map(l => l.split(" ")).collect()
distFile.flatMap(l => l.split(" ")).collect()
```

closures

Python:

```
distFile = sc.textFile("README.md")
distFile.map(lambda x: x.split(' ')).collect()
distFile.flatMap(lambda x: x.split(' ')).collect()
```

# Spark Essentials: Transformations

Scala:

```
val distFile = sc.textFile("README.md")
distFile.map(l => l.split(" ")).collect()
distFile.flatMap(l => l.split(" ")).collect()
```

closures

Python:

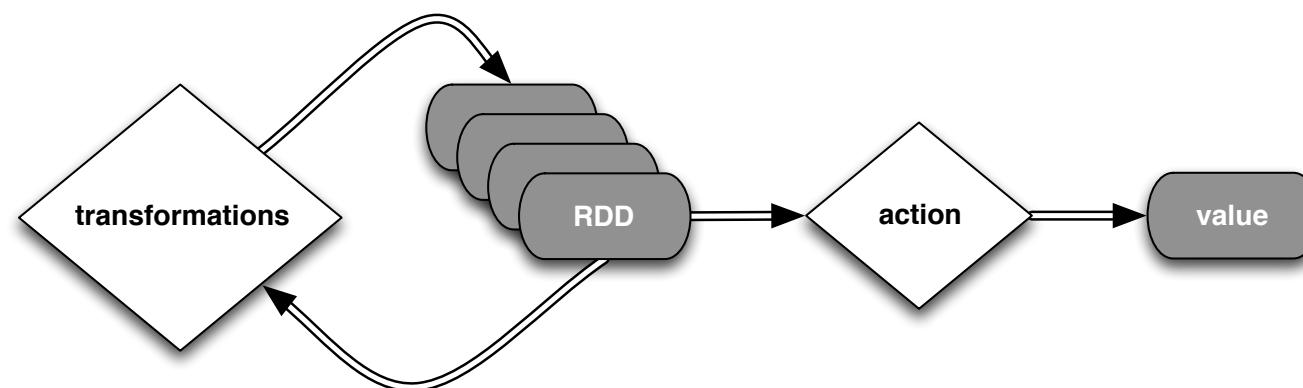

```
distFile = sc.textFile("README.md")
distFile.map(lambda x: x.split(' ')).collect()
distFile.flatMap(lambda x: x.split(' ')).collect()
```

*looking at the output, how would you compare results for map() vs. flatMap() ?*

## Spark Essentials: *Transformations*

Using closures is now possible in Java 8 with *lambda expressions* support, see the tutorial:

[databricks.com/blog/2014/04/14/Spark-with-Java-8.html](https://databricks.com/blog/2014/04/14/Spark-with-Java-8.html)

## **Spark Essentials: Transformations**

### **Java 7:**

```
JavaRDD<String> distFile = sc.textFile("README.md");

// Map each line to multiple words
JavaRDD<String> words = distFile.flatMap(
    new FlatMapFunction<String, String>() {
        public Iterable<String> call(String line) {
            return Arrays.asList(line.split(" "));
        }
    });
});
```

### **Java 8:**

```
JavaRDD<String> distFile = sc.textFile("README.md");
JavaRDD<String> words =
    distFile.flatMap(line -> Arrays.asList(line.split(" ")));
```

# Spark Essentials: Actions

action	description
<b>reduce(<i>func</i>)</b>	aggregate the elements of the dataset using a function <i>func</i> (which takes two arguments and returns one), and should also be commutative and associative so that it can be computed correctly in parallel
<b>collect()</b>	return all the elements of the dataset as an array at the driver program – usually useful after a filter or other operation that returns a sufficiently small subset of the data
<b>count()</b>	return the number of elements in the dataset
<b>first()</b>	return the first element of the dataset – similar to <i>take(1)</i>
<b>take(<i>n</i>)</b>	return an array with the first <i>n</i> elements of the dataset – currently not executed in parallel, instead the driver program computes all the elements
<b>takeSample(<i>withReplacement</i>, <i>fraction</i>, <i>seed</i>)</b>	return an array with a random sample of <i>num</i> elements of the dataset, with or without replacement, using the given random number generator seed

# Spark Essentials: Actions

<i>action</i>	<i>description</i>
<b>saveAsTextFile(path)</b>	write the elements of the dataset as a text file (or set of text files) in a given directory in the local filesystem, HDFS or any other Hadoop-supported file system. Spark will call <code>toString</code> on each element to convert it to a line of text in the file
<b>saveAsSequenceFile(path)</b>	write the elements of the dataset as a Hadoop SequenceFile in a given path in the local filesystem, HDFS or any other Hadoop-supported file system. Only available on RDDs of key-value pairs that either implement Hadoop's Writable interface or are implicitly convertible to Writable (Spark includes conversions for basic types like Int, Double, String, etc).
<b>countByKey()</b>	only available on RDDs of type (K, V). Returns a `Map` of (K, Int) pairs with the count of each key
<b>foreach(func)</b>	run a function <code>func</code> on each element of the dataset – usually done for side effects such as updating an accumulator variable or interacting with external storage systems

# **Spark Essentials: Actions**

## **Scala:**

```
val f = sc.textFile("README.md")
val words = f.flatMap(l => l.split(" ")).map(word => (word, 1))
words.reduceByKey(_ + _).collect.foreach(println)
```

## **Python:**

```
from operator import add
f = sc.textFile("README.md")
words = f.flatMap(lambda x: x.split(' ')).map(lambda x: (x, 1))
words.reduceByKey(add).collect()
```

## **Spark Essentials:** Persistence

Spark can *persist* (or cache) a dataset in memory across operations

Each node stores in memory any slices of it that it computes and reuses them in other actions on that dataset – often making future actions more than 10x faster

The cache is *fault-tolerant*: if any partition of an RDD is lost, it will automatically be recomputed using the transformations that originally created it

# Spark Essentials: Persistence

<i>transformation</i>	<i>description</i>
<b>MEMORY_ONLY</b>	Store RDD as deserialized Java objects in the JVM. If the RDD does not fit in memory, some partitions will not be cached and will be recomputed on the fly each time they're needed. This is the default level.
<b>MEMORY_AND_DISK</b>	Store RDD as deserialized Java objects in the JVM. If the RDD does not fit in memory, store the partitions that don't fit on disk, and read them from there when they're needed.
<b>MEMORY_ONLY_SER</b>	Store RDD as serialized Java objects (one byte array per partition). This is generally more space-efficient than deserialized objects, especially when using a fast serializer, but more CPU-intensive to read.
<b>MEMORY_AND_DISK_SER</b>	Similar to MEMORY_ONLY_SER, but spill partitions that don't fit in memory to disk instead of recomputing them on the fly each time they're needed.
<b>DISK_ONLY</b>	Store the RDD partitions only on disk.
<b>MEMORY_ONLY_2,</b> <b>MEMORY_AND_DISK_2, etc</b>	Same as the levels above, but replicate each partition on two cluster nodes.

# Spark Essentials: Persistence

## Scala:

```
val f = sc.textFile("README.md")
val w = f.flatMap(l => l.split(" ")).map(word => (word, 1)).cache()
w.reduceByKey(_ + _).collect.foreach(println)
```

## Python:

```
from operator import add
f = sc.textFile("README.md")
w = f.flatMap(lambda x: x.split(' ')).map(lambda x: (x, 1)).cache()
w.reduceByKey(add).collect()
```

## **Spark Essentials:** *Broadcast Variables*

Broadcast variables let programmer keep a read-only variable cached on each machine rather than shipping a copy of it with tasks

For example, to give every node a copy of a large input dataset efficiently

Spark also attempts to distribute broadcast variables using efficient broadcast algorithms to reduce communication cost

## **Spark Essentials:** *Broadcast Variables*

**Scala:**

```
val broadcastVar = sc.broadcast(Array(1, 2, 3))
broadcastVar.value
```

**Python:**

```
broadcastVar = sc.broadcast(list(range(1, 4)))
broadcastVar.value
```

## **Spark Essentials:** Accumulators

Accumulators are variables that can only be “added” to through an associative operation

Used to implement counters and sums, efficiently in parallel

Spark natively supports accumulators of numeric value types and standard mutable collections, and programmers can extend for new types

Only the driver program can read an accumulator’s value, not the tasks

# **Spark Essentials: Accumulators**

**Scala:**

```
val accum = sc.accumulator(0)
sc.parallelize(Array(1, 2, 3, 4)).foreach(x => accum += x)

accum.value
```

**Python:**

```
accum = sc.accumulator(0)
rdd = sc.parallelize([1, 2, 3, 4])
def f(x):
    global accum
    accum += x

rdd.foreach(f)

accum.value
```

# Spark Essentials: Accumulators

Scala:

```
val accum = sc.accumulator(0)
sc.parallelize(Array(1, 2, 3, 4)).foreach(x => accum += x)
```

accum.value

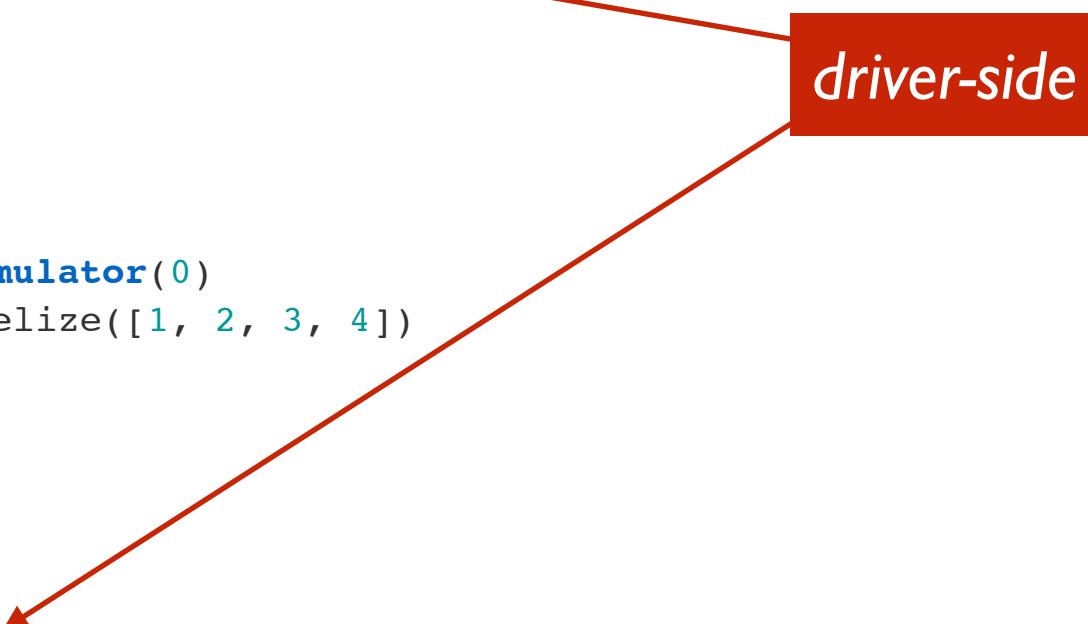

Python:

```
accum = sc.accumulator(0)
rdd = sc.parallelize([1, 2, 3, 4])
def f(x):
    global accum
    accum += x
```

rdd.foreach(f)

accum.value

## Spark Essentials: $(K, V)$ pairs

### Scala:

```
val pair = (a, b)  
  
pair._1 // => a  
pair._2 // => b
```

### Python:

```
pair = (a, b)  
  
pair[0] # => a  
pair[1] # => b
```

### Java:

```
Tuple2 pair = new Tuple2(a, b);  
  
pair._1 // => a  
pair._2 // => b
```

## **Spark Essentials:** API Details

For more details about the Scala/Java API:

**[spark.apache.org/docs/latest/api/scala/index.html#org.apache.spark.package](http://spark.apache.org/docs/latest/api/scala/index.html#org.apache.spark.package)**

For more details about the Python API:

**[spark.apache.org/docs/latest/api/python/](http://spark.apache.org/docs/latest/api/python/)**

## 03: Intro Spark Apps

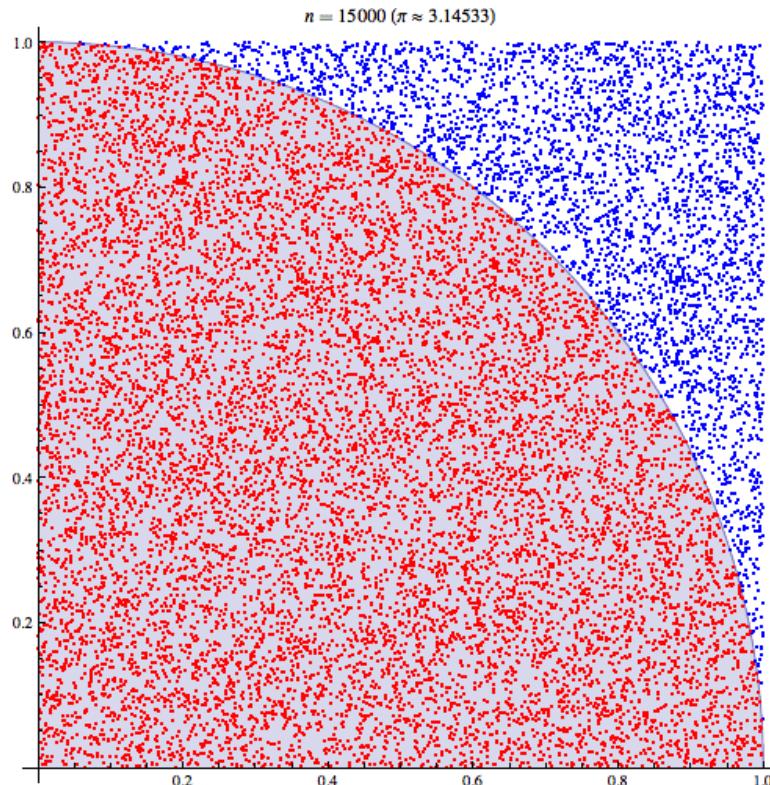

# Spark Examples

**lecture/lab: 10 min**

## Spark Examples: Estimate Pi

Next, try using a **Monte Carlo method** to estimate the value of Pi

```
./bin/run-example SparkPi 2 local
```

[wikipedia.org/wiki/Monte\\_Carlo\\_method](https://en.wikipedia.org/wiki/Monte_Carlo_method)

# Spark Examples: Estimate Pi

```
import scala.math.random
import org.apache.spark._

/** Computes an approximation to pi */
object SparkPi {
  def main(args: Array[String]) {
    val conf = new SparkConf().setAppName("Spark Pi")
    val spark = new SparkContext(conf)

    val slices = if (args.length > 0) args(0).toInt else 2
    val n = 100000 * slices

    val count = spark.parallelize(1 to n, slices).map { i =>
      val x = random * 2 - 1
      val y = random * 2 - 1
      if (x*x + y*y < 1) 1 else 0
    }.reduce(_ + _)

    println("Pi is roughly " + 4.0 * count / n)
    spark.stop()
  }
}
```

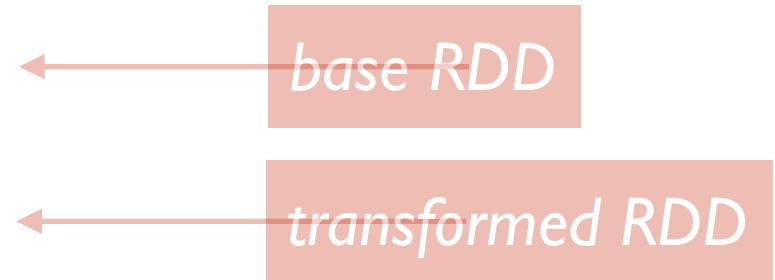

# Spark Examples: Estimate Pi

```
val count = sc.parallelize(1 to n, slices)  
  
.map { i =>  
    val x = random * 2 - 1  
    val y = random * 2 - 1  
    if (x*x + y*y < 1) 1 else 0  
}  
  
.reduce(_ + _)
```

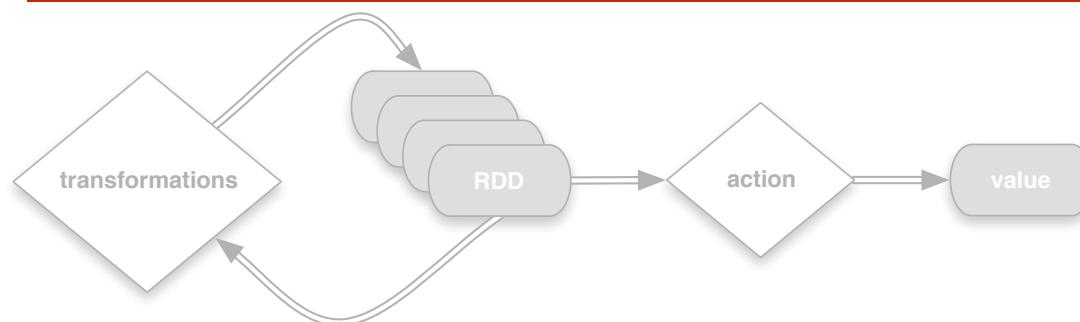

## Spark Examples: Estimate Pi

```
val count  
  
.map  
val  
val  
if  
}  
  
.reduce
```

**Checkpoint:**  
what estimate do you get for Pi?

## Spark Examples: K-Means

Next, try using **K-Means** to cluster a set of vector values:

```
cp ..../data/examples-data/kmeans_data.txt .
./bin/run-example SparkKMeans kmeans_data.txt 3 0.01 local
```

Based on the data set:

```
0.0 0.0 0.0
0.1 0.1 0.1
0.2 0.2 0.2
9.0 9.0 9.0
9.1 9.1 9.1
9.2 9.2 9.2
```

Please refer to the source code in:

```
examples/src/main/scala/org/apache/spark/examples/SparkKMeans.scala
```

## **Spark Examples: PageRank**

Next, try using **PageRank** to rank the relationships in a graph:

```
cp ..../data/examples-data/pagerank_data.txt .  
./bin/run-example SparkPageRank pagerank_data.txt 10 local
```

Based on the data set:

```
1 2  
1 3  
1 4  
2 1  
3 1  
4 1
```

Please refer to the source code in:

```
examples/src/main/scala/org/apache/spark/examples/SparkPageRank.scala
```

**(lunch)**

**lunch: 60 min -ish**

## Lunch:

Depending on the venue:

- *if not catered, we're off to find food!*
- *we'll lock the room to secure valuables*

Let's take an hour or so...

Networking is some of the best part  
of these workshops!

## 04: Data Workflows

# Unifying the Pieces

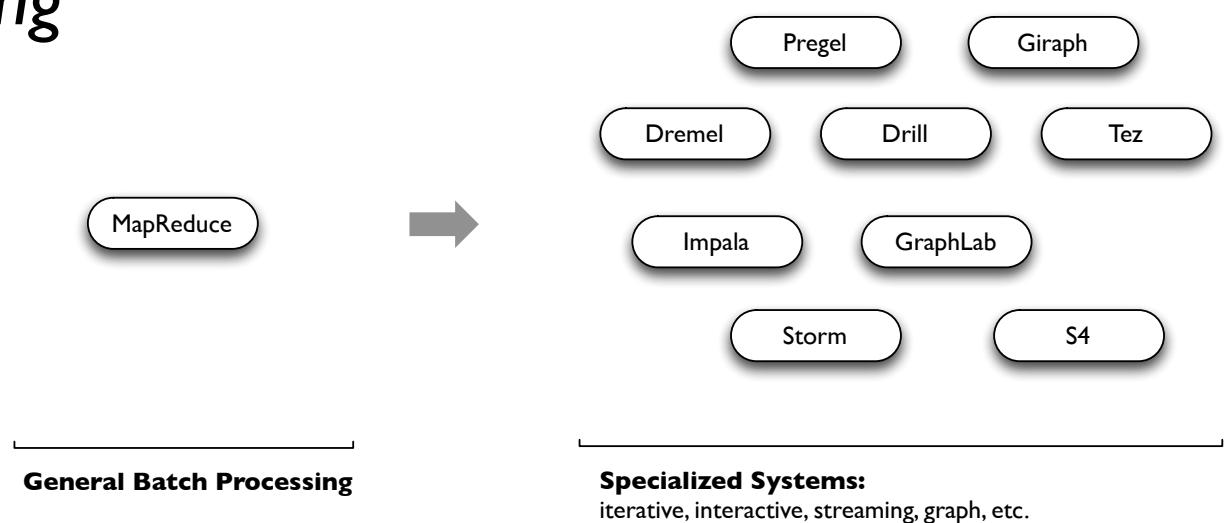

**lecture/demo: 40 min**

## Data Workflows:

Again, unlike the various specialized systems, Spark's goal was to *generalize* MapReduce to support new apps within same engine

Two reasonably small additions allowed the previous specialized models to be expressed within Spark:

- *fast data sharing*
- *general DAGs*

## **Data Workflows:**

Unifying the pieces into a single app:  
Spark SQL, Streaming, Shark, MLlib, etc.

- discuss how the same business logic can be deployed across multiple topologies
- demo Spark SQL
- demo Spark Streaming
- discuss features/benefits for Shark
- discuss features/benefits for MLlib

## **Data Workflows:** Spark SQL

*blurs the lines between RDDs and relational tables*

**[spark.apache.org/docs/latest/sql-programming-guide.html](http://spark.apache.org/docs/latest/sql-programming-guide.html)**

intermix SQL commands to query external data, along with complex analytics, in a single app:

- allows SQL extensions based on MLlib
- Shark is being migrated to Spark SQL

*Spark SQL: Manipulating Structured Data Using Spark*

Michael Armbrust, Reynold Xin (2014-03-24)

**[databricks.com/blog/2014/03/26/Spark-SQL-manipulating-structured-data-using-Spark.html](https://databricks.com/blog/2014/03/26/Spark-SQL-manipulating-structured-data-using-Spark.html)**

# Data Workflows: Spark SQL

```
val sqlContext = new org.apache.spark.sql.SQLContext(sc)
import sqlContext._

// Define the schema using a case class.
case class Person(name: String, age: Int)

// Create an RDD of Person objects and register it as a table.
val people = sc.textFile("examples/src/main/resources/
people.txt").map(_.split(",")).map(p => Person(p(0), p(1).trim.toInt))

people.registerAsTable("people")

// SQL statements can be run by using the sql methods provided by sqlContext.
val teenagers = sql("SELECT name FROM people WHERE age >= 13 AND age <= 19")

// The results of SQL queries are SchemaRDDs and support all the
// normal RDD operations.
// The columns of a row in the result can be accessed by ordinal.
teenagers.map(t => "Name: " + t(0)).collect().foreach(println)
```

# Data Workflows: Spark SQL

```
val sqlContext
import

// Define the schema using a case class.
case class

// Create an RDD of Person objects and register it as a table.
val people
people.txt"
people

// SQL statements can be run via the sqlContext.
val teenagers

// The results of SQL queries are SchemaRDDs and support all the
// normal RDD operations.
// The columns of a row in the result can be accessed by ordinal.
teenagers
```

Checkpoint:  
what name do you get?

## **Data Workflows:** Spark SQL

Source files, commands, and expected output are shown in this gist:

[gist.github.com/ceteri/  
f2c3486062c9610eac1d#file-05-spark-sql-txt](https://gist.github.com/ceteri/f2c3486062c9610eac1d#file-05-spark-sql-txt)

## Data Workflows: Spark SQL: queries in HiveQL

```
//val sc: SparkContext // An existing SparkContext.  
//NB: example on laptop lacks a Hive MetaStore  
val hiveContext = new org.apache.spark.sql.hive.HiveContext(sc)  
  
// Importing the SQL context gives access to all the  
// public SQL functions and implicit conversions.  
import hiveContext._  
  
hql("CREATE TABLE IF NOT EXISTS src (key INT, value STRING)")  
hql("LOAD DATA LOCAL INPATH 'examples/src/main/resources/kv1.txt' INTO TABLE src")  
  
// Queries are expressed in HiveQL  
hql("FROM src SELECT key, value").collect().foreach(println)
```

## **Data Workflows:** Spark SQL: Parquet

Parquet is a columnar format, supported by many different Big Data frameworks

<http://parquet.io/>

Spark SQL supports read/write of parquet files, automatically preserving the schema of the original data (**HUGE** benefits)

Modifying the previous example...

# Data Workflows: Spark SQL: Parquet

```
val sqlContext = new org.apache.spark.sql.SQLContext(sc)
import sqlContext._

// Define the schema using a case class.
case class Person(name: String, age: Int)

// Create an RDD of Person objects and register it as a table.
val people = sc.textFile("examples/src/main/resources/people.txt").
map(_.split(",")).map(p => Person(p(0), p(1).trim.toInt))
people.registerAsTable("people")

// The RDD is implicitly converted to a SchemaRDD
## allowing it to be stored using parquet.
people.saveAsParquetFile("people.parquet")

// Read in the parquet file created above. Parquet files are
// self-describing so the schema is preserved.
// The result of loading a parquet file is also a JavaSchemaRDD.
val parquetFile = sqlContext.parquetFile("people.parquet")

//Parquet files can also be registered as tables and then used in
// SQL statements.
parquetFile.registerAsTable("parquetFile")
val teenagers =
  sql("SELECT name FROM parquetFile WHERE age >= 13 AND age <= 19")
teenagers.collect().foreach(println)
```

## **Data Workflows:** Spark SQL: Parquet

In particular, check out the *query plan* in the console output:

```
== Query Plan ==
Project [name#4:0]
  Filter ((age#5:1 >= 13) && (age#5:1 <= 19))
    ParquetTableScan [name#4,age#5], (ParquetRelation people.parquet), None
```

generated from the SQL query:

```
SELECT name FROM parquetFile WHERE age >= 13 AND age <= 19
```

## Data Workflows: Spark SQL: Parquet

An output directory get created for each Parquet “file”:

```
$ ls people.parquet/
._SUCCESS.crc      .part-r-1.parquet.crc  _SUCCESS          part-r-1.parquet
._metadata.crc    .part-r-2.parquet.crc  _metadata        part-r-2.parquet

$ file people.parquet/part-r-1.parquet
people.parquet/part-r-1.parquet: Par archive data
```

[gist.github.com/ceteri/f2c3486062c9610eac1d#file-05-spark-sql-parquet-txt](https://gist.github.com/ceteri/f2c3486062c9610eac1d#file-05-spark-sql-parquet-txt)

## **Data Workflows:** Spark SQL: DSL

Spark SQL also provides a DSL for queries

Scala symbols represent columns in the underlying table, which are identifiers prefixed with a tick (`)

For a full list of the functions supported, see:

[spark.apache.org/docs/latest/api/scala/index.html#org.apache.spark.sql.SchemaRDD](http://spark.apache.org/docs/latest/api/scala/index.html#org.apache.spark.sql.SchemaRDD)

...again, modifying the previous example

For a comparison, check out LINQ:

[linqpad.net/WhyLINQBeatsSQL.aspx](http://linqpad.net/WhyLINQBeatsSQL.aspx)

# Data Workflows: Spark SQL: DSL

```
val sqlContext = new org.apache.spark.sql.SQLContext(sc)
import sqlContext._

// Define the schema using a case class.
case class Person(name: String, age: Int)

// Create an RDD of Person objects and register it as a table.
val people = sc.textFile("examples/src/main/resources/
people.txt").map(_.split(",")).map(p => Person(p(0), p(1).trim.toInt))

people.registerAsTable("people")

// The following is the same as
// 'SELECT name FROM people WHERE age >= 13 AND age <= 19'
val teenagers = people.where('age >= 13).where('age <= 19).select('name)

// The results of SQL queries are SchemaRDDs and support all the
// normal RDD operations.
// The columns of a row in the result can be accessed by ordinal.
teenagers.map(t => "Name: " + t(0)).collect().foreach(println)
```

## **Data Workflows:** Spark SQL: PySpark

Let's also take a look at Spark SQL in PySpark,  
using **IPython Notebook**...

[spark.apache.org/docs/latest/api/scala/  
index.html#org.apache.spark.sql.SchemaRDD](http://spark.apache.org/docs/latest/api/scala/index.html#org.apache.spark.sql.SchemaRDD)

To launch:

```
IPYTHON_OPTS="notebook --pylab inline" ./bin/pyspark
```

**IP[y]:** IPython  
Interactive Computing

# Data Workflows: Spark SQL: PySpark

```
from pyspark.sql import SQLContext
from pyspark import SparkContext
sc = SparkContext()
sqlCtx = SQLContext(sc)

# Load a text file and convert each line to a dictionary
lines = sc.textFile("examples/src/main/resources/people.txt")
parts = lines.map(lambda l: l.split(","))
people = parts.map(lambda p: {"name": p[0], "age": int(p[1])})

# Infer the schema, and register the SchemaRDD as a table.
# In future versions of PySpark we would like to add support
# for registering RDDs with other datatypes as tables
peopleTable = sqlCtx.inferSchema(people)
peopleTable.registerAsTable("people")

# SQL can be run over SchemaRDDs that have been registered as a table
teenagers = sqlCtx.sql("SELECT name FROM people WHERE age >= 13 AND age <= 19")

teenNames = teenagers.map(lambda p: "Name: " + p.name)
teenNames.collect()
```

## **Data Workflows:** Spark SQL: PySpark

Source files, commands, and expected output  
are shown in this gist:

[gist.github.com/ceteri/  
f2c3486062c9610eac1d#file-05-pyspark-sql-txt](https://gist.github.com/ceteri/f2c3486062c9610eac1d#file-05-pyspark-sql-txt)

## **Data Workflows:** *Spark Streaming*

Spark Streaming extends the core API to allow high-throughput, fault-tolerant stream processing of live data streams

**[spark.apache.org/docs/latest/streaming-programming-guide.html](http://spark.apache.org/docs/latest/streaming-programming-guide.html)**

*Discretized Streams:A Fault-Tolerant Model for Scalable Stream Processing*

Matei Zaharia, Tathagata Das, Haoyuan Li,  
Timothy Hunter, Scott Shenker, Ion Stoica  
Berkeley EECS (2012-12-14)

**[www.eecs.berkeley.edu/Pubs/TechRpts/2012/EECS-2012-259.pdf](http://www.eecs.berkeley.edu/Pubs/TechRpts/2012/EECS-2012-259.pdf)**

## Data Workflows: Spark Streaming

Data can be ingested from many sources:

**Kafka, Flume, Twitter, ZeroMQ, TCP sockets, etc.**

Results can be pushed out to filesystems,  
databases, live dashboards, etc.

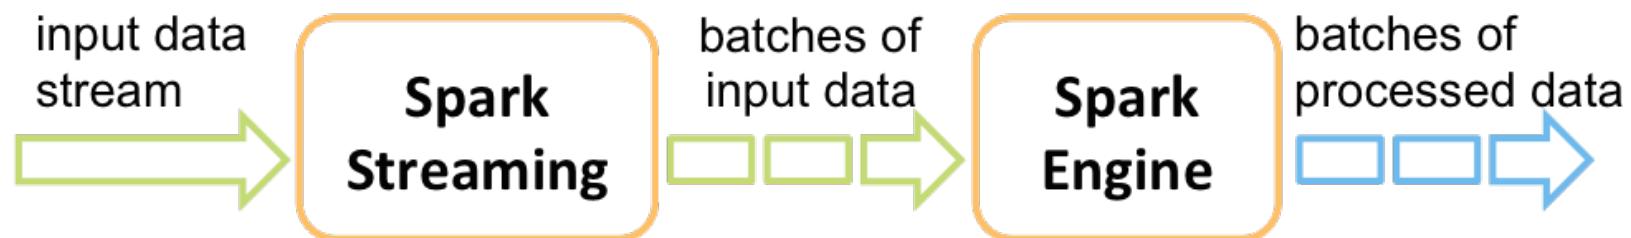

Spark's built-in machine learning algorithms and  
graph processing algorithms can be applied to  
data streams

# Data Workflows: Spark Streaming

## Comparisons:

- Twitter **Storm**
- Yahoo! **s4**
- Google **MillWheel**

## Data Workflows: Spark Streaming

```
# in one terminal run the NetworkWordCount example in Spark Streaming
# expecting a data stream on the localhost:9999 TCP socket
./bin/run-example org.apache.spark.examples.streaming.NetworkWordCount
localhost 9999
```

```
# in another terminal use Netcat http://nc110.sourceforge.net/
# to generate a data stream on the localhost:9999 TCP socket
$ nc -lk 9999
hello world
hi there fred
what a nice world there
```

# Data Workflows: Spark Streaming

```
import org.apache.spark.streaming._  
import org.apache.spark.streaming.StreamingContext._  
  
// Create a StreamingContext with a SparkConf configuration  
val ssc = new StreamingContext(sparkConf, Seconds(10))  
  
// Create a DStream that will connect to serverIP:serverPort  
val lines = ssc.socketTextStream(serverIP, serverPort)  
  
// Split each line into words  
val words = lines.flatMap(_.split(" "))  
  
// Count each word in each batch  
val pairs = words.map(word => (word, 1))  
val wordCounts = pairs.reduceByKey(_ + _)  
  
// Print a few of the counts to the console  
wordCounts.print()  
  
ssc.start()          // Start the computation  
ssc.awaitTermination() // Wait for the computation to terminate
```

# Data Workflows: Spark Streaming

## What the stream analysis produced:

```
14/04/19 13:41:28 INFO scheduler.TaskSetManager: Finished TID 3 in 17 ms on localhost  
(progress: 1/1)  
14/04/19 13:41:28 INFO scheduler.TaskSchedulerImpl: Removed TaskSet 3.0, whose tasks  
have all completed, from pool

## 05: Data Workflows

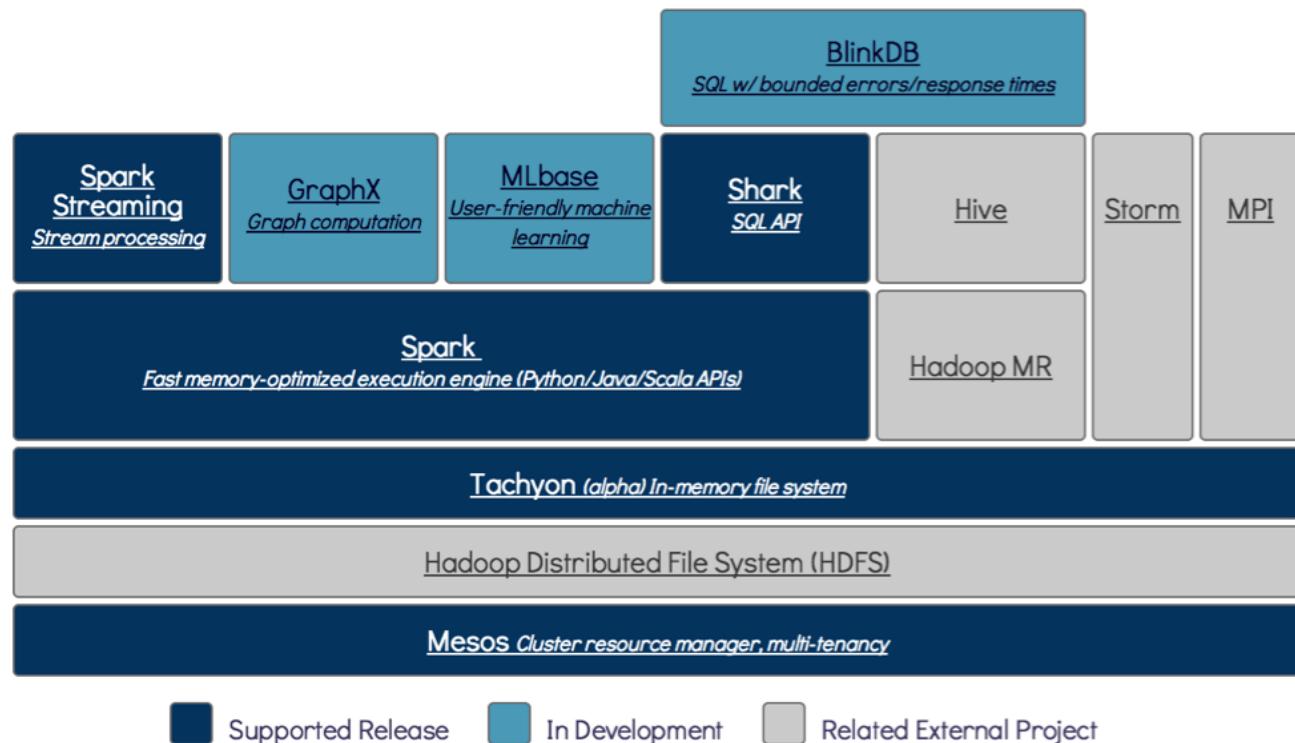

# Advanced Topics

**discussion: 20 min**

## Advanced Topics:

Other **BDAS** projects running atop Spark for graphs, sampling, and memory sharing:

- **BlinkDB**
- **GraphX**
- **Tachyon**

BlinkDB [blinkdb.org/](http://blinkdb.org/)

*massively parallel, approximate query engine for running interactive SQL queries on large volumes of data*

- allows users to trade-off query accuracy for response time
- enables interactive queries over massive data by running queries on data samples
- presents results annotated with meaningful error bars

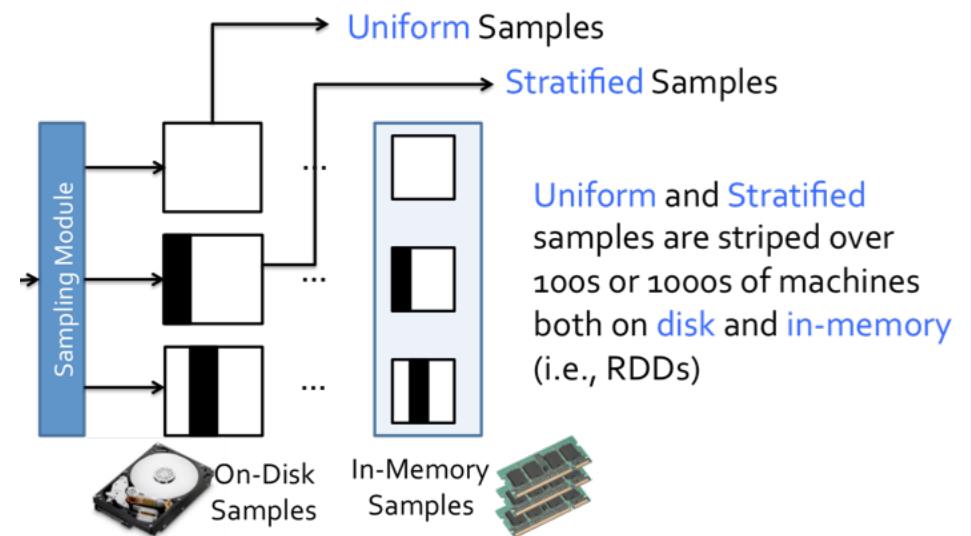

## Advanced Topics: BlinkDB

*“Our experiments on a 100 node cluster show that BlinkDB can answer queries on up to 17 TBs of data in less than 2 seconds (over 200 x faster than Hive), within an error of 2-10%.”*

*BlinkDB: Queries with Bounded Errors and Bounded Response Times on Very Large Data*

Sameer Agarwal, Barzan Mozafari, Aurojit Panda,  
Henry Milner, Samuel Madden, Ion Stoica  
EuroSys (2013)

[dl.acm.org/citation.cfm?id=2465355](https://dl.acm.org/citation.cfm?id=2465355)

# Advanced Topics: BlinkDB

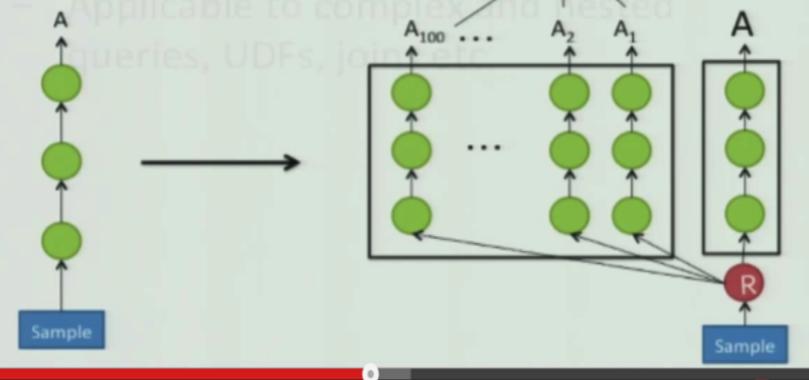

*Deep Dive into BlinkDB*  
Sameer Agarwal  
[youtu.be/WoTTbdk0kCA](https://youtu.be/WoTTbdk0kCA)

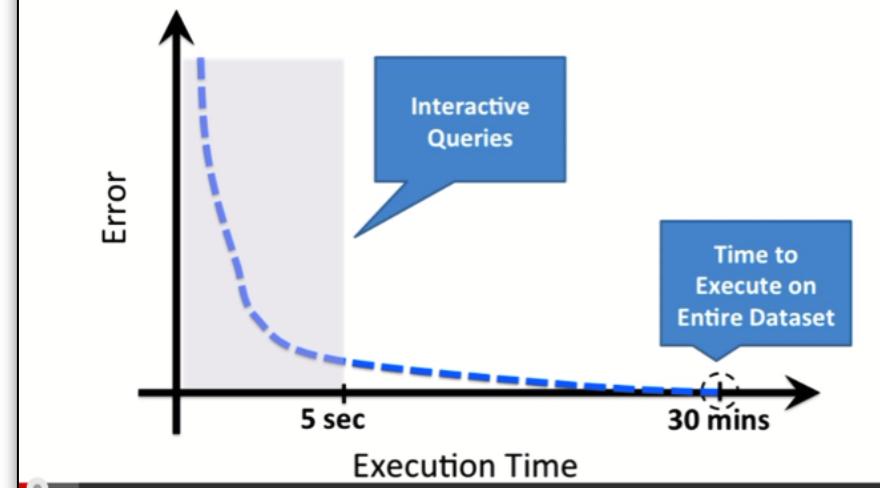

## Error Estimation

### Generalized Aggregate Functions

- Statistical Bootstrap
- Applicable to complex and nested queries, UDFs, joins etc.

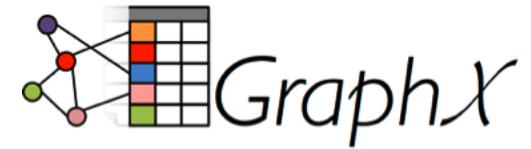

## Speed/Accuracy Trade-off

*Introduction to using BlinkDB*  
Sameer Agarwal  
[youtu.be/Pc8\\_EM9PKqY](https://youtu.be/Pc8_EM9PKqY)

## **Advanced Topics: GraphX**

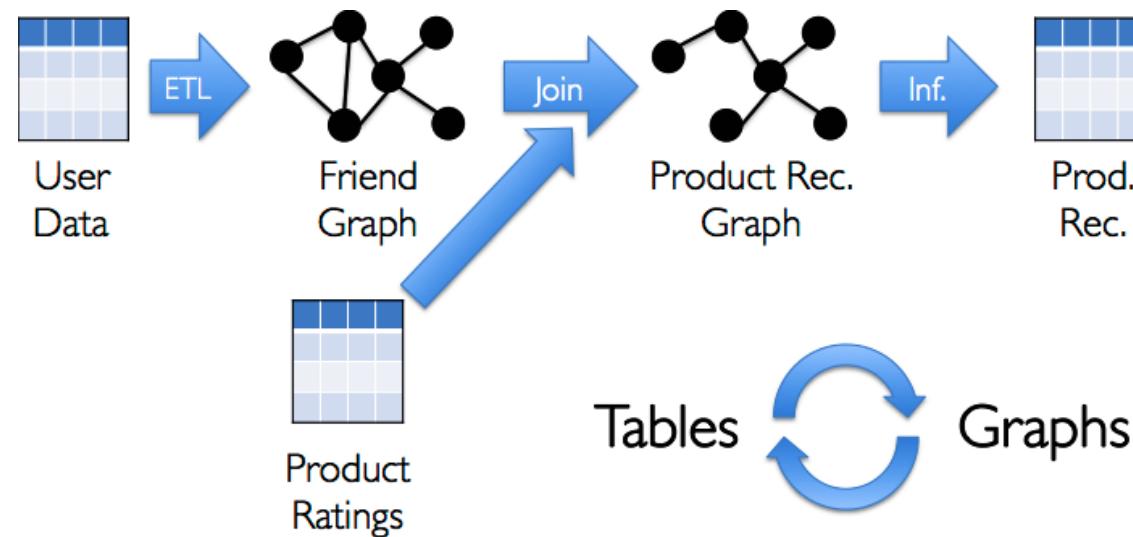

**GraphX** [amplab.github.io/graphx/](https://amplab.github.io/graphx/)

*extends the distributed fault-tolerant collections API  
and interactive console of Spark with a new graph API  
which leverages recent advances in graph systems  
(e.g., GraphLab) to enable users to easily and  
interactively build, transform, and reason about graph  
structured data at scale*

## Advanced Topics: GraphX

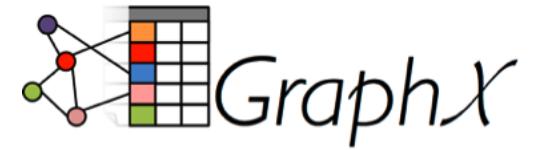

*unifying graphs and tables*

[spark.apache.org/docs/latest/graphx-programming-guide.html](http://spark.apache.org/docs/latest/graphx-programming-guide.html)

[ampcamp.berkeley.edu/big-data-mini-course/graph-analytics-with-graphx.html](http://ampcamp.berkeley.edu/big-data-mini-course/graph-analytics-with-graphx.html)

# Advanced Topics: GraphX

*Introduction to GraphX*

Joseph Gonzalez, Reynold Xin  
[youtu.be/mKEn9C5bRck](https://youtu.be/mKEn9C5bRck)

The image shows a screenshot of a video player interface. In the center, there is a video frame displaying a man with glasses speaking at a podium. To the right of the video frame, there is a white slide with text and icons. The slide has the following content:

- A small icon of a laptop with a purple bar below it.
- The text: "GraphX Unifies Data-Parallel and Graph-Parallel Systems".
- A red "Spark Table API" logo with the text: "RDDs, Fault-tolerance, and task scheduling".
- A red "GraphLab Graph API" logo with the text: "graph representation and execution".

## **Advanced Topics: Tachyon**

Tachyon [tachyon-project.org/](http://tachyon-project.org/)

- fault tolerant distributed file system enabling reliable file sharing at memory-speed across cluster frameworks
- achieves high performance by leveraging lineage information and using memory aggressively
- caches working set files in memory thereby avoiding going to disk to load datasets that are frequently read
- enables different jobs/queries and frameworks to access cached files at memory speed

## **Advanced Topics: Tachyon**

More details:

**[tachyon-project.org/Command-Line-Interface.html](http://tachyon-project.org/Command-Line-Interface.html)**

**[ampcamp.berkeley.edu/big-data-mini-course/tachyon.html](http://ampcamp.berkeley.edu/big-data-mini-course/tachyon.html)**

**[timothysc.github.io/blog/2014/02/17/bdas-tachyon/](http://timothysc.github.io/blog/2014/02/17/bdas-tachyon/)**

# Advanced Topics: Tachyon

*Introduction to Tachyon*

Haoyuan Li

[youtu.be/4IMAsd2LNEE](https://youtu.be/4IMAsd2LNEE)

The slide features a video feed of a speaker on the left and a line graph on the right. The graph compares the execution time (second) of three systems as data size increases from 0 to 250 GB. Tachyon shows significantly lower execution times than both Spark Cache and HDFS, especially at larger data sizes. A red arrow points to the HDFS data series with the text "More than 75x speedup". Another red arrow points to the text "Tachyon outperforms Spark cache because of JAVA GC".

Conviva Spark Query (I/O intensive)

Execution time (second)

Tachyon

Spark Cache

HDFS

More than 75x speedup

Tachyon outperforms Spark cache because of JAVA GC

# **06: Spark in Production**

## **The Full SDLC**

**lecture/lab: 75 min**

## **Spark in Production:**

In the following, let's consider the progression through a full software development lifecycle, step by step:

- 1. build**
- 2. deploy**
- 3. monitor**

## **Spark in Production:** *Build*

builds:

- build/run a JAR using Java + Maven
- SBT primer
- build/run a JAR using Scala + SBT

## **Spark in Production:** *Build: Java*

The following sequence shows how to build a JAR file from a Java app, using Maven

**[maven.apache.org/guides/introduction/introduction-to-the-pom.html](https://maven.apache.org/guides/introduction/introduction-to-the-pom.html)**

- First, connect into a *different* directory where you have space to create several files
- Then run the following commands...

## Spark in Production: Build: Java

```
# Java source (cut&paste 1st following slide)
mkdir -p src/main/java
cat > src/main/java/SimpleApp.java

# project model (cut&paste 2nd following slide)
cat > pom.xml

# copy a file to use for data
cp $SPARK_HOME/README.md .

# build the JAR
mvn clean package

# run the JAR
mvn exec:java -Dexec.mainClass="SimpleApp"
```

# Spark in Production: Build: Java

```
/** SimpleApp.java */
import org.apache.spark.api.java.*;
import org.apache.spark.api.java.function.Function;

public class SimpleApp {
    public static void main(String[] args) {
        String logFile = "README.md";
        JavaSparkContext sc = new JavaSparkContext("local", "Simple App",
            "$SPARK_HOME", new String[]{"target/simple-project-1.0.jar"});
        JavaRDD<String> logData = sc.textFile(logFile).cache();

        long numAs = logData.filter(new Function<String, Boolean>() {
            public Boolean call(String s) { return s.contains("a"); }
        }).count();

        long numBs = logData.filter(new Function<String, Boolean>() {
            public Boolean call(String s) { return s.contains("b"); }
        }).count();

        System.out.println("Lines with a: " + numAs + ", lines with b: " + numBs);
    }
}
```

# Spark in Production: Build: Java

```
<project>
  <groupId>edu.berkeley</groupId>
  <artifactId>simple-project</artifactId>
  <modelVersion>4.0.0</modelVersion>
  <name>Simple Project</name>
  <packaging>jar</packaging>
  <version>1.0</version>
  <repositories>
    <repository>
      <id>Akka repository</id>
      <url>http://repo.akka.io/releases</url>
    </repository>
  </repositories>
  <dependencies>
    <dependency> <!-- Spark dependency -->
      <groupId>org.apache.spark</groupId>
      <artifactId>spark-core_2.10</artifactId>
      <version>0.9.1</version>
    </dependency>
    <dependency>
      <groupId>org.apache.hadoop</groupId>
      <artifactId>hadoop-client</artifactId>
      <version>2.2.0</version>
    </dependency>
  </dependencies>
</project>
```

## **Spark in Production:** *Build: Java*

Source files, commands, and expected output are shown in this gist:

[gist.github.com/ceteri/f2c3486062c9610eac1d#file-04-java-maven-txt](https://gist.github.com/ceteri/f2c3486062c9610eac1d#file-04-java-maven-txt)

...and the JAR file that we just used:

```
ls target/simple-project-1.0.jar
```

## **Spark in Production:** *Build: SBT*

**builds:**

- build/run a JAR using Java + Maven
- SBT primer
- build/run a JAR using Scala + SBT

## **Spark in Production: Build: SBT**

**SBT is the Simple Build Tool for Scala:**

[www.scala-sbt.org/](http://www.scala-sbt.org/)

This is included with the Spark download, and does not need to be installed separately.

Similar to Maven, however it provides for *incremental compilation* and an *interactive shell*, among other innovations.

SBT project uses *StackOverflow* for Q&A, that's a good resource to study further:

[stackoverflow.com/tags/sbt](http://stackoverflow.com/tags/sbt)

## Spark in Production: Build: SBT

<i>command</i>	<i>description</i>
<b>clean</b>	delete all generated files (in the <i>target</i> directory)
<b>package</b>	create a JAR file
<b>run</b>	run the JAR (or main class, if named)
<b>compile</b>	compile the main sources (in <i>src/main/scala</i> and <i>src/main/java</i> directories)
<b>test</b>	compile and run all tests
<b>console</b>	launch a Scala interpreter
<b>help</b>	display detailed help for specified commands

## **Spark in Production:** *Build: Scala*

builds:

- build/run a JAR using Java + Maven
- SBT primer
- build/run a JAR using Scala + SBT

## **Spark in Production:** *Build: Scala*

The following sequence shows how to build a JAR file from a Scala app, using SBT

- First, this requires the “source” download, not the “binary”
- Connect into the SPARK\_HOME directory
- Then run the following commands...

## **Spark in Production: Build: Scala**

```
# Scala source + SBT build script on following slides  
  
cd simple-app  
  
./sbt/sbt -Dsbt.ivy.home=../sbt/ivy package  
  
./spark/bin/spark-submit \  
--class "SimpleApp" \  
--master local[*] \  
target/scala-2.10/simple-project_2.10-1.0.jar
```

# Spark in Production: Build: Scala

```
/** SimpleApp.scala */
import org.apache.spark.SparkContext
import org.apache.spark.SparkContext._

object SimpleApp {
  def main(args: Array[String]) {
    val logFile = "README.md" // Should be some file on your system
    val sc = new SparkContext("local", "Simple App", "SPARK_HOME",
      List("target/scala-2.10/simple-project_2.10-1.0.jar"))
    val logData = sc.textFile(logFile, 2).cache()

    val numAs = logData.filter(line => line.contains("a")).count()
    val numBs = logData.filter(line => line.contains("b")).count()

    println("Lines with a: %s, Lines with b: %s".format(numAs, numBs))
  }
}
```

# **Spark in Production: Build: Scala**

```
name := "Simple Project"

version := "1.0"

scalaVersion := "2.10.4"

libraryDependencies += "org.apache.spark" % "spark-core_2.10" % "1.0.0"

resolvers += "Akka Repository" at "http://repo.akka.io/releases/"
```

## **Spark in Production:** *Build: Scala*

Source files, commands, and expected output  
are shown in this gist:

[gist.github.com/ceteri/  
f2c3486062c9610eac1d#file-04-scala-sbt-txt](https://gist.github.com/ceteri/f2c3486062c9610eac1d#file-04-scala-sbt-txt)

## **Spark in Production:** *Build: Scala*

The expected output from running the JAR is shown in this gist:

[gist.github.com/ceteri/  
f2c3486062c9610eac1d#file-04-run-jar-txt](https://gist.github.com/ceteri/f2c3486062c9610eac1d#file-04-run-jar-txt)

Note that console lines which begin with “[error]” are not errors – that’s simply the console output being written to *stderr*

## **Spark in Production:** *Deploy*

deploy JAR to Hadoop cluster, using these alternatives:

- discuss how to run atop Apache Mesos
- discuss how to install on CM
- discuss how to run on HDP
- discuss how to run on MapR
- discuss how to run on EC2
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production:** Deploy: Mesos

deploy JAR to Hadoop cluster, using these alternatives:

- discuss how to run atop Apache Mesos
- discuss how to install on CM
- discuss how to run on HDP
- discuss how to run on MapR
- discuss how to run on EC2
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production:** Deploy: Mesos

**Apache Mesos**, from which Apache Spark originated...

*Running Spark on Mesos*

**[spark.apache.org/docs/latest/running-on-mesos.html](http://spark.apache.org/docs/latest/running-on-mesos.html)**

*Run Apache Spark on Apache Mesos*

Mesosphere tutorial based on AWS

**[mesosphere.io/learn/run-spark-on-mesos/](http://mesosphere.io/learn/run-spark-on-mesos/)**

*Getting Started Running Apache Spark on Apache Mesos*

O'Reilly Media webcast

**[oreilly.com/pub/e/2986](http://oreilly.com/pub/e/2986)**

## **Spark in Production: Deploy: CM**

deploy JAR to Hadoop cluster, using these alternatives:

- discuss how to run atop Apache Mesos
- **discuss how to install on CM**
- discuss how to run on HDP
- discuss how to run on MapR
- discuss how to run on EC2
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production: Deploy: CM**

Cloudera Manager 4.8.x:

**[cloudera.com/content/cloudera-content/cloudera-docs/CM4Ent/latest/Cloudera-Manager-Installation-Guide/cmig\\_spark\\_installation\\_standalone.html](http://cloudera.com/content/cloudera-content/cloudera-docs/CM4Ent/latest/Cloudera-Manager-Installation-Guide/cmig_spark_installation_standalone.html)**

- 5 steps to install the Spark parcel
- 5 steps to configure and start the Spark service

Also check out Cloudera Live:

**[cloudera.com/content/cloudera/en/products-and-services/cloudera-live.html](http://cloudera.com/content/cloudera/en/products-and-services/cloudera-live.html)**

## **Spark in Production: Deploy: HDP**

deploy JAR to Hadoop cluster, using these alternatives:

- discuss how to run atop Apache Mesos
- discuss how to install on CM
- **discuss how to run on HDP**
- discuss how to run on MapR
- discuss how to run on EC2
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production: Deploy: HDP**

Hortonworks provides support for running Spark on HDP:

**[spark.apache.org/docs/latest/hadoop-third-party-distributions.html](http://spark.apache.org/docs/latest/hadoop-third-party-distributions.html)**

**[hortonworks.com/blog/announcing-hdp-2-1-tech-preview-component-apache-spark/](http://hortonworks.com/blog/announcing-hdp-2-1-tech-preview-component-apache-spark/)**

## **Spark in Production:** Deploy: MapR

deploy JAR to Hadoop cluster, using these alternatives:

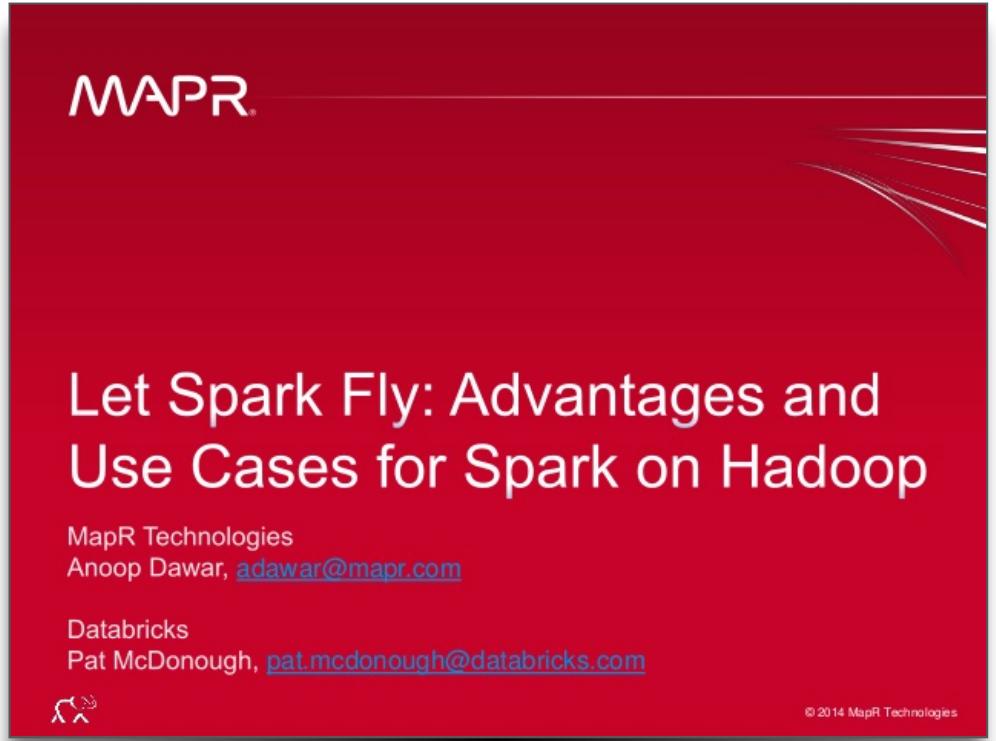

- discuss how to run atop Apache Mesos
- discuss how to install on CM
- discuss how to run on HDP
- **discuss how to run on MapR**
- discuss how to run on EC2
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production: Deploy: MapR**

MapR Technologies provides support for running Spark on the MapR distros:

**[mapr.com/products/apache-spark](http://mapr.com/products/apache-spark)**

**[slideshare.net/MapRTechnologies/map-r-databricks-webinar-4x3](http://slideshare.net/MapRTechnologies/map-r-databricks-webinar-4x3)**

MAPR

Let Spark Fly: Advantages and Use Cases for Spark on Hadoop

MapR Technologies  
Anoop Dawar, [adawar@mapr.com](mailto:adawar@mapr.com)

Databricks  
Pat McDonough, [pat.mcdonough@databricks.com](mailto:pat.mcdonough@databricks.com)

© 2014 MapR Technologies

## **Spark in Production: Deploy: EC2**

deploy JAR to Hadoop cluster, using these alternatives:

- discuss how to run atop Apache Mesos
- discuss how to install on CM
- discuss how to run on HDP
- discuss how to run on MapR
- **discuss how to run on EC2**
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production:** Deploy: EC2

Running Spark on Amazon AWS **EC2**:

[spark.apache.org/docs/latest/ec2-scripts.html](http://spark.apache.org/docs/latest/ec2-scripts.html)

## **Spark in Production: Deploy: SIMR**

deploy JAR to Hadoop cluster, using these alternatives:

- discuss how to run atop Apache Mesos
- discuss how to install on CM
- discuss how to run on HDP
- discuss how to run on MapR
- discuss how to run on EC2
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production: Deploy: SIMR**

Spark in MapReduce (SIMR) – quick way for Hadoop MRI users to deploy Spark:

**[databricks.github.io/simr/](https://databricks.github.io/simr/)**

**[spark-summit.org/talk/reddy-simr-let-your-spark-jobs-simmer-inside-hadoop-clusters/](https://spark-summit.org/talk/reddy-simr-let-your-spark-jobs-simmer-inside-hadoop-clusters/)**

- Sparks run on Hadoop clusters without any install or required admin rights
- SIMR launches a Hadoop job that only contains mappers, includes Scala+Spark

```
./simr jar_file main_class parameters  
[-outdir=] [-slots=N] [-unique]
```

## **Spark in Production: Deploy:YARN**

deploy JAR to Hadoop cluster, using these alternatives:

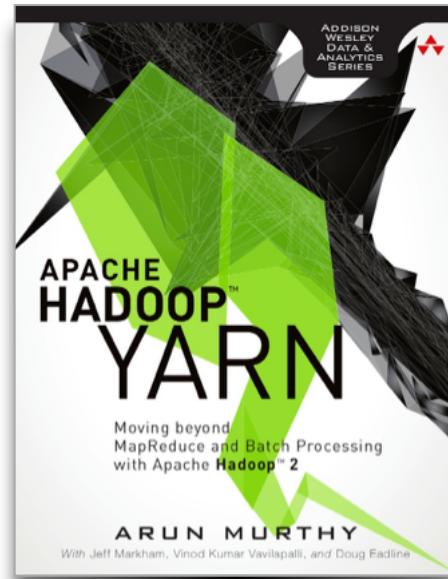

- discuss how to run atop Apache Mesos
- discuss how to install on CM
- discuss how to run on HDP
- discuss how to run on MapR
- discuss how to run on EMR
- discuss using **SIMR** (run shell within MR job)
- ...or, simply run the JAR on YARN

## **Spark in Production: Deploy:YARN**

**[spark.apache.org/docs/latest/running-on-yarn.html](http://spark.apache.org/docs/latest/running-on-yarn.html)**

- Simplest way to deploy Spark apps in production
- Does not require admin, just deploy apps to your Hadoop cluster

Apache Hadoop YARN  
**Arun Murthy, et al.**  
[amazon.com/dp/0321934504](http://amazon.com/dp/0321934504)

## **Spark in Production:** Deploy: HDFS examples

Exploring data sets loaded from HDFS...

1. launch a Spark cluster using EC2 script
2. load data files into HDFS
3. run Spark shell to perform *WordCount*

NB: be sure to use *internal* IP addresses on AWS for the “`hdfs://...`” URLs

# Spark in Production: Deploy: HDFS examples

```
# http://spark.apache.org/docs/latest/ec2-scripts.html
cd $SPARK_HOME/ec2

export AWS_ACCESS_KEY_ID=$AWS_ACCESS_KEY
export AWS_SECRET_ACCESS_KEY=$AWS_SECRET_KEY
./spark-ec2 -k spark -i ~/spark.pem -s 2 -z us-east-1b launch foo

# can review EC2 instances and their security groups to identify master
# ssh into master
./spark-ec2 -k spark -i ~/spark.pem -s 2 -z us-east-1b login foo

# use ./ephemeral-hdfs/bin/hadoop to access HDFS
/root/ephemeral-hdfs/bin/hadoop fs -mkdir /tmp
/root/ephemeral-hdfs/bin/hadoop fs -put CHANGES.txt /tmp

# now is the time when we Spark
cd /root/spark
export SPARK_HOME=$(pwd)

SPARK_HADOOP_VERSION=1.0.4 sbt/sbt assembly

/root/ephemeral-hdfs/bin/hadoop fs -put CHANGES.txt /tmp
./bin/spark-shell
```

## Spark in Production: Deploy: HDFS examples

```
/** NB: replace host IP with EC2 internal IP address **/ 

val f = sc.textFile("hdfs://10.72.61.192:9000/foo/CHANGES.txt")
val counts =
  f.flatMap(line => line.split(" ")).map(word => (word, 1)).reduceByKey(_ + _)

counts.collect().foreach(println)
counts.saveAsTextFile("hdfs://10.72.61.192:9000/foo/wc")
```

## **Spark in Production: Deploy: HDFS examples**

Let's check the results in HDFS...

```
root@ephemeral-hdfs/bin/hadoop fs -cat /tmp/wc/part-*
(Add$ ,1)
(alpha ,2)
(ssh ,1)
(graphite ,1)
(canonical ,2)
ASF ,3)
(display ,4)
(synchronization ,2)
(instead ,7)
(javadoc ,1)
(hsaputra/update-pom-asf ,1)
```

...

## **Spark in Production: Monitor**

review UI features

**[spark.apache.org/docs/latest/monitoring.html](http://spark.apache.org/docs/latest/monitoring.html)**

**<http://<master>:8080/>**

**<http://<master>:50070/>**

- verify: is my job still running?
- drill-down into *workers* and *stages*
- examine *stdout* and *stderr*
- discuss how to diagnose / troubleshoot

# Spark in Production: Monitor:AWS Console

The screenshot shows the AWS EC2 Management Console interface. The left sidebar contains navigation links for EC2 Dashboard, Events, Tags, Reports, Instances, Images, Elastic Block Store, Network & Security, and Auto Scaling. The main area displays three running instances of type m1.large in us-east-1b. The instance details for i-f58e6fa5 are shown in the bottom right.

Instance ID	Instance Type	Availability Zone	Instance State	Status Checks	Alarm Status
i-f58e6fa5	m1.large	us-east-1b	running	2/2 checks ...	None
i-aa9372fa	m1.large	us-east-1b	running	2/2 checks ...	None
i-ab9372fb	m1.large	us-east-1b	running	2/2 checks ...	None

**Instance: i-f58e6fa5 Public DNS: ec2-54-235-63-161.compute-1.amazonaws.com**

Description	Status Checks	Monitoring	Tags
Instance ID: i-f58e6fa5			
Public DNS: ec2-54-235-63-161.compute-1.amazonaws.com

# Spark in Production: Monitor: Spark Console

The screenshot shows a web browser window with the following details:

- Title Bar:** Shows two tabs: "Spark Master at spark://ec2-54-235-63-161.compute-1.amazonaws.com:7077" and "EC2 Management Console".
- Address Bar:** Displays the URL "ec2-54-235-63-161.compute-1.amazonaws.com:8080".
- Content Area:**
  - Header:** "Spark Master at spark://ec2-54-235-63-161.compute-1.amazonaws.com:7077"
  - System Statistics:**
    - URL: spark://ec2-54-235-63-161.compute-1.amazonaws.com:7077
    - Workers: 2
    - Cores: 4 Total, 0 Used
    - Memory: 12.6 GB Total, 0.0 B Used
    - Applications: 0 Running, 1 Completed
    - Drivers: 0 Running, 0 Completed
  - Workers Table:**

ID	Address	State	Cores	Memory
worker-20140419152337-ip-10-153-137-98.ec2.internal-52681	ip-10-153-137-98.ec2.internal:52681	ALIVE	2 (0 Used)	6.3 GB (0.0 B Used)
worker-20140419152337-ip-10-64-65-77.ec2.internal-45453	ip-10-64-65-77.ec2.internal:45453	ALIVE	2 (0 Used)	6.3 GB (0.0 B Used)
  - Running Applications Table:**

ID	Name	Cores	Memory per Node	Submitted Time	User	State	Duration
app-20140419153324-0000	Spark shell	4	6.0 GB	2014/04/19 15:33:24	root	FINISHED	15 s
  - Completed Applications Table:**

ID	Name	Cores	Memory per Node	Submitted Time	User	State	Duration
app-20140419153324-0000	Spark shell	4	6.0 GB	2014/04/19 15:33:24	root	FINISHED	15 s

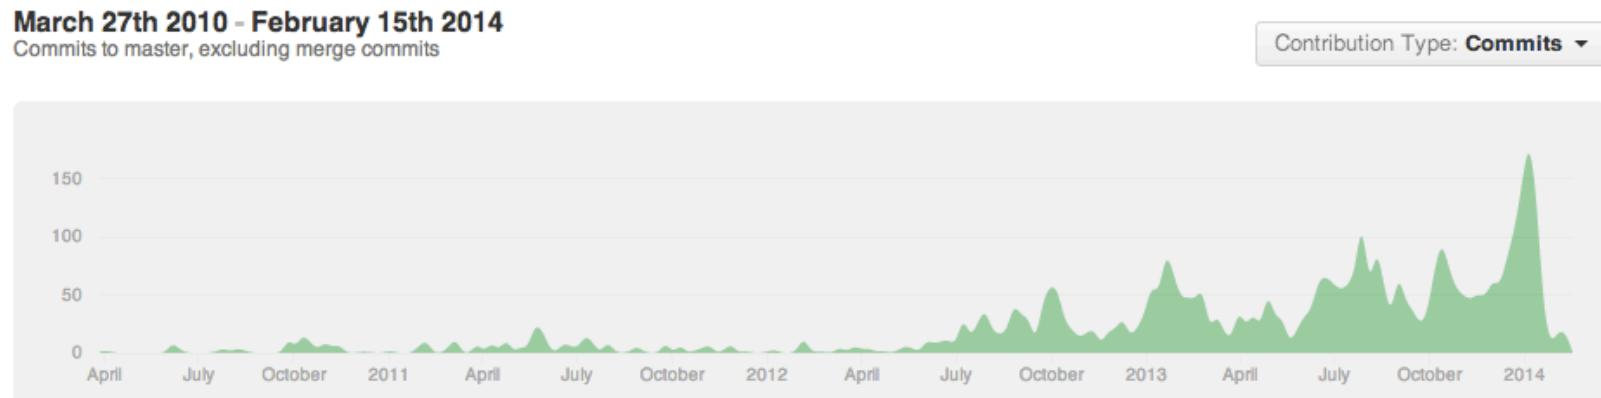

## 07: Summary

# Case Studies

**discussion: 30 min**

## Summary: Spark has lots of activity!

- 2nd Apache project [ohloh.net/orgs/apache](http://ohloh.net/orgs/apache)
- most active in the Big Data stack

## *Spark at Twitter: Evaluation & Lessons Learnt*

**Sriram Krishnan**

[slideshare.net/krishflix/seattle-spark-meetup-spark-at-twitter](https://www.slideshare.net/krishflix/seattle-spark-meetup-spark-at-twitter)

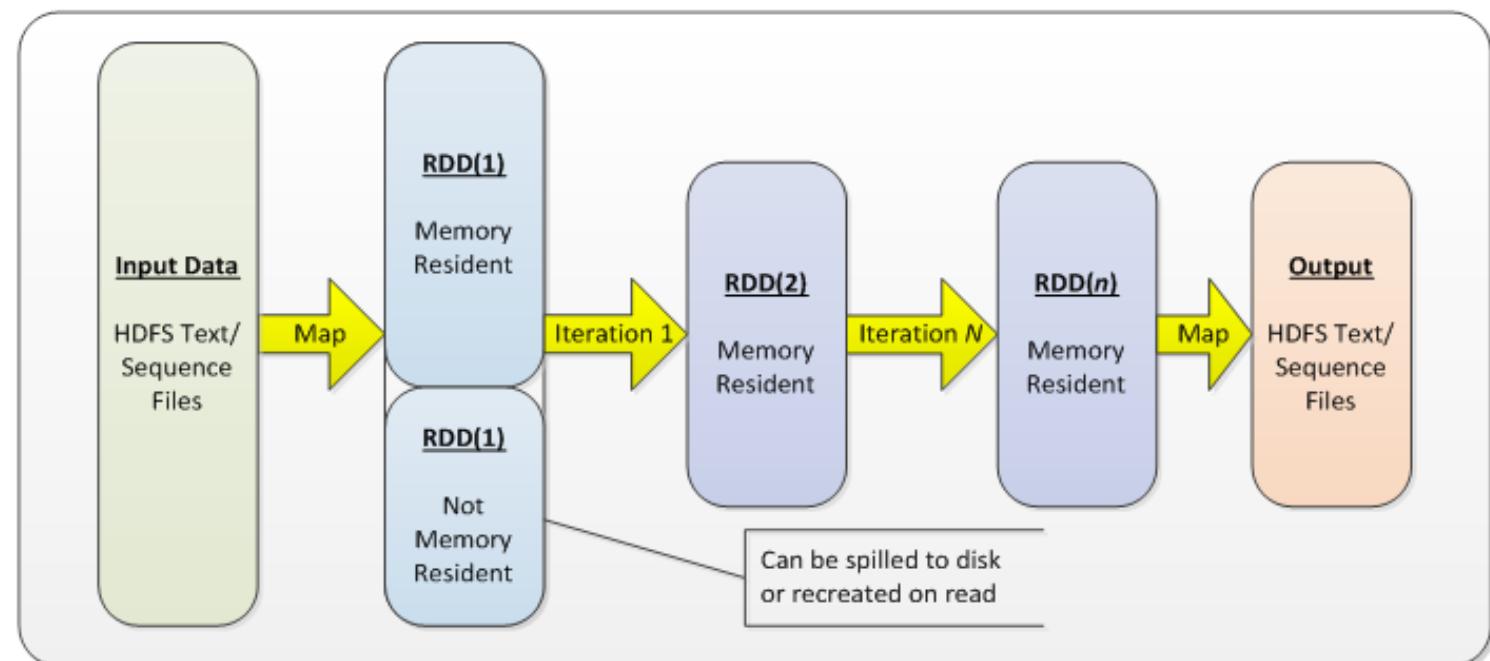

- Spark can be more interactive, efficient than MR
  - *Support for iterative algorithms and caching*
  - *More generic than traditional MapReduce*
- Why is Spark faster than Hadoop MapReduce?
  - *Fewer I/O synchronization barriers*
  - *Less expensive shuffle*
  - *More complex the DAG, greater the performance improvement*

## Summary: Case Studies

### Using Spark to Ignite Data Analytics

[ebaytechblog.com/2014/05/28/using-spark-to-ignite-data-analytics/](http://ebaytechblog.com/2014/05/28/using-spark-to-ignite-data-analytics/)

## **Summary: Case Studies**

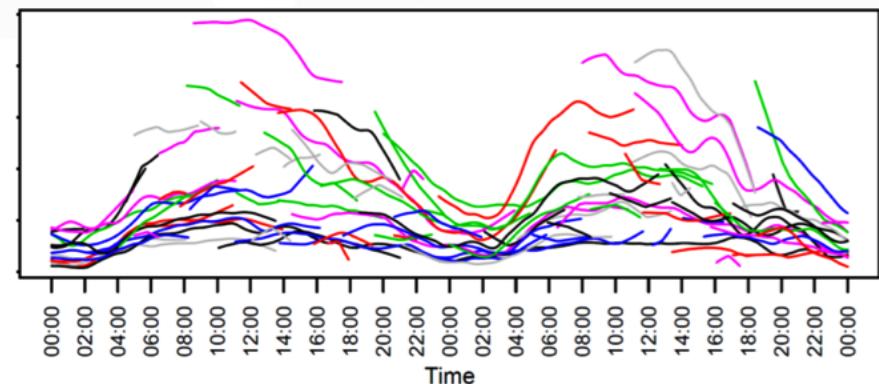

*Hadoop and Spark Join Forces in Yahoo*

**Andy Feng**

[spark-summit.org/talk/feng-hadoop-and-spark-join-forces-at-yahoo/](http://spark-summit.org/talk/feng-hadoop-and-spark-join-forces-at-yahoo/)

### II. CHALLENGE: SPEED

- ♦ Ex. Item CTR in Yahoo homepage Today Module
  - \* Short Lifetimes
  - \* Temporal effect
  - \* Breaking news

- ♦ Models should be constructed hourly or faster

## **Summary:** Case Studies

### *Collaborative Filtering with Spark*

**Chris Johnson**

[slideshare.net/MrChrisJohnson/collaborative-filtering-with-spark](https://slideshare.net/MrChrisJohnson/collaborative-filtering-with-spark)

- collab filter (ALS) for music recommendation
- Hadoop suffers from I/O overhead
- show a progression of code rewrites, converting a Hadoop-based app into efficient use of Spark

## *Why Spark is the Next Top (Compute) Model*

**Dean Wampler**

[slideshare.net/deanwampler/spark-the-next-top-compute-model](https://www.slideshare.net/deanwampler/spark-the-next-top-compute-model)

- Hadoop: most algorithms are much harder to implement in this restrictive map-then-reduce model
- Spark: fine-grained “combinators” for composing algorithms
- slide #67, any questions?

## *Open Sourcing Our Spark Job Server*

**Evan Chan**

[engineering.ooyala.com/blog/open-sourcing-our-spark-job-server](https://engineering.ooyala.com/blog/open-sourcing-our-spark-job-server)

- [github.com/ooyala/spark-jobserver](https://github.com/ooyala/spark-jobserver)
- REST server for submitting, running, managing Spark jobs and contexts
- company vision for Spark is as a multi-team big data service
- shares Spark RDDs in one SparkContext among multiple jobs

*Beyond Word Count:  
Productionalizing Spark Streaming  
Ryan Weald*

[spark-summit.org/talk/weald-beyond-word-count-productionalizing-spark-streaming/](http://spark-summit.org/talk/weald-beyond-word-count-productionalizing-spark-streaming/)

[blog.cloudera.com/blog/2014/03/letting-it-flow-with-spark-streaming/](http://blog.cloudera.com/blog/2014/03/letting-it-flow-with-spark-streaming/)

- overcoming 3 major challenges encountered while developing production streaming jobs
- write streaming applications the same way you write batch jobs, reusing code
- stateful, exactly-once semantics out of the box
- integration of **Algebird**

## *Installing the Cassandra / Spark OSS Stack*

**Al TobeY**

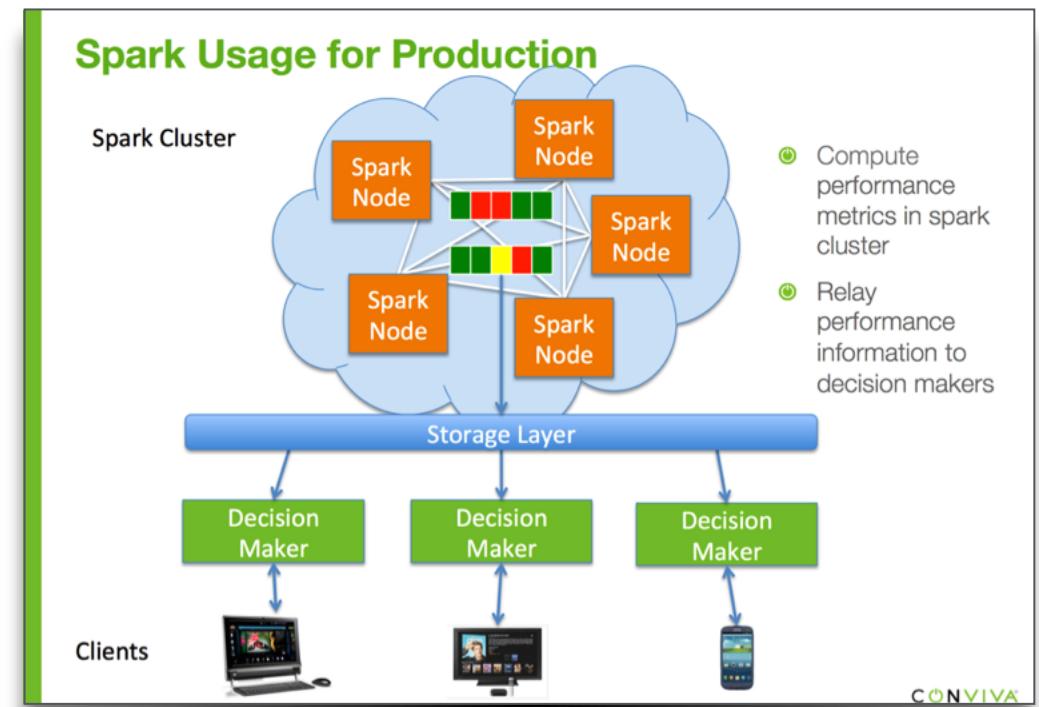

[tobert.github.io/post/2014-07-15-installing-cassandra-spark-stack.html](https://tobert.github.io/post/2014-07-15-installing-cassandra-spark-stack.html)

- install+config for Cassandra and Spark together
- *spark-cassandra-connector* integration
- examples show a Spark shell that can access tables in Cassandra as RDDs with types pre-mapped and ready to go

*One platform for all: real-time, near-real-time, and offline video analytics on Spark*

**Davis Shepherd, Xi Liu**

[spark-summit.org/talk/one-platform-for-all-real-time-near-real-time-and-offline-video-analytics-on-spark](http://spark-summit.org/talk/one-platform-for-all-real-time-near-real-time-and-offline-video-analytics-on-spark)

## **08: Summary**

# **Follow-Up**

**discussion: 20 min**

## **Summary:**

- discuss follow-up courses, certification, etc.
- links to videos, books, additional material for self-paced deep dives
- check out the archives:  
**[spark-summit.org](http://spark-summit.org)**
- be sure to complete the course survey:  
**<http://goo.gl/QpBSnR>**

## **Summary: Community + Events**

Community and upcoming events:

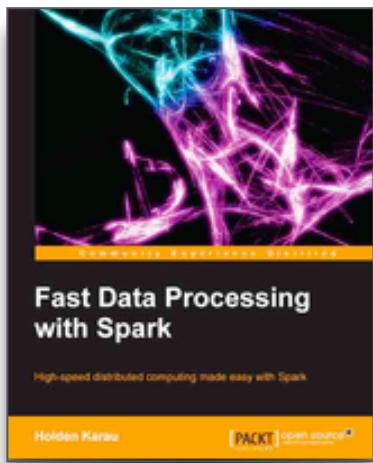

- **[Spark Meetups Worldwide](#)**
- **[strataconf.com/stratany2014](#)** NYC, Oct 15-17
- **[spark.apache.org/community.html](#)**

## **Summary:** *Email Lists*

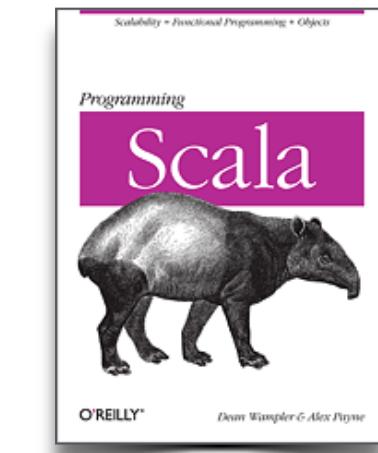

Contribute to Spark and related OSS projects via the email lists:

- **[user@spark.apache.org](mailto:user@spark.apache.org)**
  - usage questions, help, announcements
- **[dev@spark.apache.org](mailto:dev@spark.apache.org)**
  - for people who want to contribute code

# **Summary:** Suggested Books + Videos

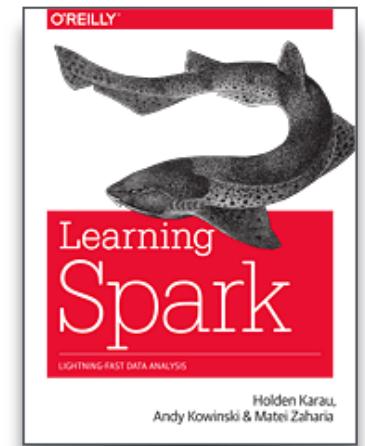

*Fast Data Processing with Spark*  
**Holden Karau**  
Packt (2013)  
[shop.oreilly.com/product/9781782167068.do](http://shop.oreilly.com/product/9781782167068.do)

*Programming Scala*  
**Dean Wampler,  
Alex Payne**  
O'Reilly (2009)  
[shop.oreilly.com/product/9780596155964.do](http://shop.oreilly.com/product/9780596155964.do)

*Spark in Action*  
**Chris Fregly**  
Manning (2015\*)  
[sparkinaction.com/](http://sparkinaction.com/)

*Learning Spark*  
**Holden Karau,  
Andy Kowinski,  
Matei Zaharia**  
O'Reilly (2015\*)  
[shop.oreilly.com/product/0636920028512.do](http://shop.oreilly.com/product/0636920028512.do)
